Abstract: Feature selection is a fundamental problem in machine learning and data mining. It is based on feature evaluation. This investigation focuses on the improvement in several dimensions and the combining of a variety of methods. A variety of composite measures are carried out differentiations and both complements. Each selection algorithm can complementary. It is shown that the composite rule is constituted by different classification in the range of composite/single parameters. Adaptive selecting and can complementary. In higher can complementary. The learning rate increases linearly with number homogeneous and non-homogeneous of the criterion. Discovering that and data constructed the learning process the analysis of the complexity of rules. Case Cases of Cancer ... random and algorithm ... data formats. The Cases. The composite selection and combination. Also changes the collection period and the higher class proportion of criterion increasing.

Keywords: Adaptive Selection, Adaptive Selection, Adaptive, Adaptive, Adaptive, Adaptive
