*Some endocrine hormones and relative drugs (1.adrenocorticoids 2.Posterior pituitary hormones 3.insulin and oral hypoglycemic agents 4.thyroid and anti-thyroid drugs

Endocrine Glands

Adrenocortical hormones

Adrenocortical hormones are all the hormones that are secreted by adrenal

Adrenal Gland

Actually 2 glands Each portion has different functions and secretes different hormones

Composed of 3 layers (zonae) outer zone (zona glomerulosa) produces mineralocorticoid (eg.aldosterone) middle zone (zona fasciculata) produces glucocorticoids (eg.cortisol) inner zone (zona reticularis) produces zona sex hormone

Regulation

HPA (hypothalamus-pituitary-adrenal cortex) axis

Hypothalamus pituitary adrenal cortex

Structure-activity relationship of adrenocortical hormones

Glucocorticoids

GCS

C-21 OH, C-11 O or 1 OH are necessary for GCs C1-2: Antiinflammatory effects stronger, effects of water electrolyte metabolism weaker

F 9 F

C9: F C16: CH3 or OH Antiinflammatory effects stronger, effects of water electrolyte metabolism weaker.

Na

[Pharmacokinetics] Absorption: orally or injection Distribution in plasma,77% of GCS is bound to corticosteroid binding Globin(CBG or transcortin), 10% is bound to albumin, the remainder if free. Estrogen -> CCGB hepatic disease ↑CGB

Elimination: metabolized in liver C4-5 and C3-O were reduced. Excretion: urine ↑ cortisone and prednisone can be separately converted into hydrocortisone and prednisolone, Then produce the effects. (in severe hepatic disease, only hydrocortisone and prednisolone can be used)

Effects on carbohydrate metabolism: ① Effects on blood glucose: ↑ ↓ ↑ stimulate gluconeogenesis ↓ ↑ ↓ ↑ ↓ ↑

*1Effects on metabolism — C (ΔN) — 3.Effects on carbohydrate metabolism: 1 the blood glucose level $ stimulate glucagon production from amino acid and glycerol ,glyconeogenesis ab stimulate glycogen deposition in liver b$ decrease the oxidation and utilization of glucose by inhibiting the Carrier transport in peripheral tissues, the net result: hyperglycemia, may induce DM. c-C (ΔN) 2.-2-C $ 2.Effects on protein metabolism :$ stimulate protein degradation ab inhibit protein synthesis net result: negative nitrogen balance can lead to decreased muscle mass and weakness. $ C A A 1 A $ physiological effects $ C A A 1 A $ physiological effects $ C A A 1 A $ physiological effects

2) Inhibiting the activity of NOS (nitric oxide synthase), decrease the production of NO NOS L-arginine NO H2E D 2 X A (D - - - - A 5 Mechanism of anti-inflammatory action $$ C $$ 3) Inducing ACE (angiotensin converting enzyme), and accelerating the degradation of BK (bradykinin) ACE BK degradation product Ha O + E0+C A * E - - - -

b. psychosis, euphoria c. growth retardation X-1 E ⅓ ⅓ d-1 ⅓ U-1 2-B c + ⅓ 1 C C Osteoporosis (C g C C 2.Withdrawal reactions e $ {Results from too rapid withdrawal of GCS after prolonged therapy} 1) Iatrogenic adrenocortical insufficiency (adrenocortical atrophy >1 and adrenal crisis Adrenal crisis: nausea,vomiting,weakness, hypotension, hypoglycemia, shock B v-1⅓ d-1 ⅓ U-1 2-B c + ⅓ 1 C C g C C >2 C 2 1 C S 1-2 ⅓Mechanism: the HPA axis is suppressed 1-C E Too much GCS in the plasma can inhibit the release of ACTH and CRH due to negative feedback. And it it take a long time for the pituitary and hypothalamus to recover function. Many patients recover from GCS-induced HPA suppression within several weeks to months. However, in some individuals, the time to recovery can be one year or longer. To avoid such kind of adverse reaction, when GCS does need to be stopped after a long time use, we should decrease the dose slowly.
