Equivalence of interest rate models and lattice gases

Dan Pirjol

(Submitted on 4 Apr 2012)

We consider the class of short rate interest rate models for which the short rate is proportional to the exponential of a Gaussian Markov process $x(t)$ in the terminal measure $r(t) = a(t) \exp(x(t))$. These models include the Black, Derman, Toy and Black, Karasinski models in the terminal measure. We show that such interest rate models are equivalent with lattice gases with attractive two-body interaction $V(t_1, t_2) = -\text{Cov}(x(t_1), x(t_2))$. We consider in some detail the Black, Karasinski model with $x(t)$ an Ornstein, Uhlenbeck process, and show that it is similar with a lattice gas model considered by Kac and Helfand, with attractive long-range two-body interactions $V(x, y) = -\alpha (e^{-\gamma |x - y|} - e^{-\gamma (x + y)})$. An explicit solution for the model is given as a sum over the states of the lattice gas, which is used to show that the model has a phase transition similar to that found previously in the Black, Derman, Toy model in the terminal measure.
