

FORMING WORK GROUPS BY APPEALING TO THE RELATIONAL MATRIX

<http://www.firstlight.cn> 2009-09-10

Our study makes use of the interpersonal relationships criteria in order to present an efficient selection method applied inside a work group being part of a congregation; the study is done by means of the relational matrix. Generally speaking, the relation between two members can be unidirectional (when one member wishes to collaborate with another and the latter does not) and bidirectional (when the collaboration wish is reciprocal).
