

# A Note on Terence Tao's Paper "On the Number of Solutions to $\frac{4}{p} = \frac{1}{n_1} + \frac{1}{n_2} + \frac{1}{n_3}$ "

Chaohua Jia

(Submitted on 27 Jul 2011)

For the positive integer  $n$ , let  $f(n)$  denote the number of positive integer solutions  $(n_1, n_2, n_3)$  of the Diophantine equation  $\frac{4}{n} = \frac{1}{n_1} + \frac{1}{n_2} + \frac{1}{n_3}$ . For the prime number  $p$ ,  $f(p)$  can be split into  $f_1(p) + f_2(p)$ , where  $f_i(p)$  ( $i=1, 2$ ) counts those solutions with exactly  $i$  of denominators  $n_1, n_2, n_3$  divisible by  $p$ . Recently Terence Tao proved that  $\sum_{p < x} f_2(p) \ll x \log^2 x \log \log x$  with other results. But actually only the upper bound  $x \log^2 x \log \log^2 x$  can be obtained in his discussion. In this note we shall use an elementary method to save a factor  $\log \log x$  and recover the above estimate.
