

Handsaw quiver varieties and finite W -algebras

Hiraku Nakajima

(Submitted on 25 Jul 2011 (v1), last revised 21 Nov 2011 (this version, v3))

Following Braverman-Finkelberg-Feigin-Rybnikov ([arXiv:1008.3655](https://arxiv.org/abs/1008.3655)), we study the convolution algebra of a handsaw quiver variety, a.k.a. a parabolic Laumon space, and a finite W -algebra of type A . This is a finite analog of the AGT conjecture on 4-dimensional supersymmetric Yang-Mills theory with surface operators. Our new observation is that the C^* -fixed point set of a handsaw quiver variety is isomorphic to a graded quiver variety of type A , which was introduced by the author in connection with the representation theory of a quantum affine algebra. As an application, simple modules of the W -algebra are described in terms of IC sheaves of graded quiver varieties of type A , which were known to be related to Kazhdan-Lusztig polynomials. This gives a new proof of a conjecture by Brundan-Kleshchev on composition multiplicities on Verma modules, which was proved by Losev, in a wider context, by a different method.

Comments: 31 pages; v.2 The main result was proved earlier by Losev in a wider context by a different method; v.3 typos corrected
