

On supporting hyperplanes to convex bodies

Alessio Figalli, Young-Heon Kim, Robert J. McCann

(Submitted on 6 Jul 2011)

Given a convex set and an interior point close to the boundary, we prove the existence of a supporting hyperplane whose distance to the point is controlled, in a dimensionally quantified way, by the thickness of the convex set in the orthogonal direction. This result has important applications in the regularity theory for Monge-Ampère type equations arising in optimal transportation.
