**Abstract:**

For subharmonic functions  $u$  in  $\mathbb{R}^N$ , of Riesz measure  $\mu$ , the growth of the function  $s \mapsto \mu(s) = \int_{|\zeta| \leq s} d\mu(\zeta)$  ( $s \geq 0$ ) is described and compared with the growth of  $u$ . It is also shown that, if  $\int_{\mathbb{R}^N} u^+(x) [-\varphi'(|x|^2)] dx < +\infty$  for some decreasing  $C^1$  function  $\varphi \geq 0$ , then  $\int_{\mathbb{R}^N} \frac{1}{|\zeta|^2} \varphi(|\zeta|^2 + 1) d\mu(\zeta) < +\infty$ . Given two subharmonic functions  $u_1$  and  $u_2$ , of Riesz measures  $\mu_1$  and  $\mu_2$ , with a growth like  $u_i(x) \leq A + B|x|^\gamma \forall x \in \mathbb{R}^N$  ( $i = 1, 2$ ), it is proved that  $\mu_1 + \mu_2$  is not necessarily the Riesz measure of any subharmonic function  $u$  with such a growth as  $u(x) \leq A' + B'|x|^\gamma \forall x \in \mathbb{R}^N$  (here  $A > 0$ ,  $A' > 0$  and  $0 < B' < 2B$ ).
