Abstract: Suppose $f(x, y)$ is a positive homogeneous function defined on

$$\mathbb{U}(\mathbb{R}_+ \times \mathbb{R}_+), \text{ call } H_f(a, b; p, q) = \left[\frac{f(a^p, b^p)}{f(a^q, b^q)} \right]^{\frac{1}{p-q}} \text{ homogeneous}$$

function with two parameters. If $f(x, y)$ is 2nd differentiable, then the

monotonicity in parameters p and q of $H_f(a, b; p, q)$ depend on the signs

of $I_1 = (\ln f)_{xy}$, for variable a and b depend on the sign of

$$I_{2a} = [(\ln f)_x \ln(y/x)]_y \text{ and } I_{2b} = [(\ln f)_y \ln(x/y)]_x \text{ respectively. As}$$

applications of these results, a serial of inequalities for arithmetic mean, geometric mean, exponential mean, logarithmic mean, power-Exponential mean and exponential-geometric mean are deduced.
