**摘要:** 采用高温固相法在还原气氛下合成了 $\text{Ca}_{9(1-x-y)}\text{Al}(\text{PO}_4)_7:x\text{Ce}^{3+},y\text{Dy}^{3+}$ 荧光材料, 并对其发光特性进行了研究。XRD测试表明所合成样品为纯相 $\text{Ca}_9\text{Al}(\text{PO}_4)_7$ 晶体。在268 nm紫外光激发下, $\text{Ca}_9\text{Al}(\text{PO}_4)_7:\text{Ce}^{3+}$ 呈现峰值位于363 nm的宽带发射。在350 nm近紫外光激发下, $\text{Ca}_9\text{Al}(\text{PO}_4)_7:\text{Dy}^{3+}$ 发射光谱为窄带谱, 主峰分别位于483 nm和574 nm, 对应 $\text{Dy}^{3+}$ 的 ${}^4\text{F}_{9/2}\rightarrow{}^6\text{H}_{15/2}$ 和 ${}^4\text{F}_{9/2}\rightarrow{}^6\text{H}_{13/2}$ 特征跃迁, 呈黄白光发射。荧光光谱表明: $\text{Ce}^{3+}, \text{Dy}^{3+}$ 共掺之后, $\text{Ce}^{3+}$ 不仅对 $\text{Dy}^{3+}$ 的特征发射有明显的敏化作用, 而且通过调节 $\text{Ce}^{3+}$ 和 $\text{Dy}^{3+}$ 的掺杂比例, 可实现从黄白光到白光的颜色变化。研究发现: $\text{Ca}_{9(1-x-y)}\text{Al}(\text{PO}_4)_7:x\text{Ce}^{3+},y\text{Dy}^{3+}$ 样品中, 掺杂离子的最佳摩尔分数为 $x=0.02, y=0.02$ , 此时色坐标为(0.306, 0.313)。

**Abstract:** Phosphors  $\text{Ca}_{9(1-x-y)}\text{Al}(\text{PO}_4)_7:x\text{Ce}^{3+},y\text{Dy}^{3+}$  were synthesized by solid-state reaction method at high temperature under a reducing atmosphere of CO, and the luminescent properties of the phosphors were investigated. The X-ray diffraction patterns (XRD) show that a pure phase of  $\text{Ca}_9\text{Al}(\text{PO}_4)_7$  phosphor has been obtained after calcined at 1 200 °C. Under 268 nm excitation, the  $\text{Ca}_9\text{Al}(\text{PO}_4)_7:\text{Ce}^{3+}$  sample exhibits a broad emission band centered at 363 nm. The emission spectrum of  $\text{Ca}_9\text{Al}(\text{PO}_4)_7:\text{Dy}^{3+}$  sample under 350 nm excitation shows two characteristic emissions of  $\text{Dy}^{3+}$  located at 483 nm and 574 nm, corresponding with  ${}^4\text{F}_{9/2}\rightarrow{}^6\text{H}_{15/2}$  and  ${}^4\text{F}_{9/2}\rightarrow{}^6\text{H}_{13/2}$  transition, respectively. According to the fluorescence spectra, the characteristic emissions of  $\text{Dy}^{3+}$  are significantly sensitized by  $\text{Ce}^{3+}$  when the  $\text{Ca}_9\text{Al}(\text{PO}_4)_7$  samples are co-doped with  $\text{Ce}^{3+}$  and  $\text{Dy}^{3+}$ . Adjusting the concentration of  $\text{Ce}^{3+}$  and  $\text{Dy}^{3+}$ , the color of the phosphors can change from yellowish-white to white. The results indicate that the optimal mole fractions of  $\text{Ce}^{3+}$  and  $\text{Dy}^{3+}$  in  $\text{Ca}_{9(1-x-y)}\text{Al}(\text{PO}_4)_7:x\text{Ce}^{3+},y\text{Dy}^{3+}$  are  $x=0.02$  and  $y=0.02$ , and the chromaticity coordinate is (0.306, 0.313).

Keywords:  $\text{Ca}_9\text{Al}(\text{PO}_4)_7:\text{Ce}^{3+}, \text{Dy}^{3+}$  white emitting phosphor luminescence color coordinate
