摘要 本文详细研究了用共沉淀法制备出的TiO₂-Al₂O₃复合氧化物载体负载钯之后的催化剂催化甲烷燃烧的性能。所有的Pd/TiO₂-Al₂O₃催化剂均具有比单一氧化物载体负载的钯催化剂Pd/Al₂O₃和Pd/TiO₂好的活性; 其中

Pd/2Ti-3Al 在质量空速为33000 mL/(h·g)时T_{90%}只有395°C, 这比Pd/Al₂O₃和Pd/TiO₂的T_{90%}低了不止

50°C。TPR和¹⁸O同位素交换的结果表明Pd/2Ti-

3Al高的催化甲烷燃烧活性是由于其高的氧交换活性和适中的还原性, 这也符合我们前面工作中的结论。

XPS的结果表明在我们的研究范围内钯的分散度并不是影响催化活性的关键因素。

Abstract Pd supported on TiO₂-Al₂O₃ binary oxides prepared by coprecipitation method has been investigated for the total oxidation of methane. All Pd/TiO₂-Al₂O₃ catalysts show higher activity than Pd/Al₂O₃ and Pd/TiO₂. Among them, Pd/2Ti-3Al with a Ti/Al ratio of 2 to 3 has a T_{90%} of 395 °C at a gas hourly mass velocity of 33000 mL/(h·g), which is at least 50 °C lower than that of Pd supported on single metal oxide Al₂O₃ or TiO₂. The results of TPR and ¹⁸O-isotope exchange experiments demonstrated that the excellent activity of Pd/2Ti-3Al was due to its high oxygen mobility and moderate reducibility, which is in accordance with our previous work. XPS results indicated that the dispersion of Pd was not the key factor to influence the catalytic activity.
