摘要

通过比较10种高等水生植物(粉绿狐尾藻、水葫芦、水浮莲、金边富贵竹、荇菜、海菜花、金鱼藻、穗状狐尾藻、黑藻、苦草)培养水对集胞藻的化感作用,发现不同受试水生植物对集胞藻生长的影响存在明显差异。海菜花培养水对受试藻种的生长略有促进作用,而其他水生植物培养水均表现出不同程度的抑藻效应。抑藻效应的强弱顺序依次为:粉绿狐尾藻>水葫芦>金鱼藻>水浮莲>荇菜>穗状狐尾藻>黑藻>金边富贵竹>苦草,其中粉绿狐尾藻的抑藻效率高达89.9%。这说明受试水生植物能够释放某些化感物质到水体环境中,干扰集胞藻的正常生长。进一步研究粉绿狐尾藻、水葫芦和金鱼藻对集胞藻藻细胞吸收光谱及其特征吸收峰的影响,发现它们释放的化感物质可破坏集胞藻的叶绿素a和藻胆蛋白(包括PC和APC)的特征吸收峰,降低藻细胞对光的吸收能力,说明高等水生植物释放某些化感物质损害藻类的叶绿素a和藻胆蛋白可能是其抑制或杀死浮游藻类的重要途径之一。

关键词: 高等水生植物 化感作用 集胞藻 藻胆蛋白 叶绿素a

Abstract:

Allelopathy of culture water from ten

kinds of macrophytes on *Synahocystis* sp. was investigated. The results sh

owed that there was slightly stimulation effect for *Ottelia acuminata* cultur

e water on *Synahocystis* sp., while significant inhibition effects of other

nine mac

rophytes on the algae were performed, and their inhibition capability was as fol

lowing: M *aquaticum*>E *crassipes*>C *demersum* >P *stratiotes* >N *peltatum*>M s

picatum> H *verticillata*>D *sanderiana*>V *spiralis*, the inhibition ratio of

M *aquaticum* on *Synahocystis* sp. is up to 89.9%. By analyzing the ab

orption spectral curve and the characteristic peaks of *Synahocystis* sp. cel

I, it was found that M *aquaticum*, *Eichhornia crassipes* and C *demersum*

could secrete some allelochemicals, which destroyed the chlorophyll a and phycob
