**Abstract:** Eleven species from six families of lizards have been found in the Reşadiye (Datça) Peninsula between the years 1990-1993. In this survey the morphological characteristics such as pholidosis, color-pattern and body measurements and ratios have been investigated. Systematic positions the species of which we have a sufficient number of samples were more accurate in terms of morphological characteristics. Besides, the biological and ecological information on the species were also given.

**Key Words:** Reşadiye (Datça) Peninsula, Lacertilia, Taxonomy, Ecology
