Abstract: In this study, a total of 29 specimens (16 males, 10 females and 3 juvenile) collected from Ihlara Valley were examined. The study was based on pholidosis, coloration and pattern, and body measurement as well as ecological and biologic observations. In conclusion it was determined that the population in the vicinity of Aksaray possess the same features as the nominate subspecies.

Key Words: *Lacerta cappadocica*, Ihlara Valley, Taxonomy, Subspecies
