摘要:

利用同源克隆和RACE方法在商陆(*Phytolacca acinosa*)中得到一个推测的小G蛋白ArfGTPase激活蛋白ArfGAP(ArfGTPase activating protein)的全长cDNA序列PaAGAP。PaAGAP序列编码332个氨基酸,蛋白含有保守的锌指结构域(CX₂CX₁₆CX₂C类)和C2结构域。实时荧光定量PCR表明在寒、旱、盐和重金属的不同时间胁迫下,PaAGAP可以被诱导,表达量有不同程度的上调。由此推测PaAGAP可能是通过快速启动转录和翻译,使ARF失活,抑制植物生长素极性运输,来参与植物逆境反应的。

Abstract:

A full-length cDNA of an ArfGAP (PaAGAP) encoding 332 amino acids was cloned from *Phytolacca acinosa* by using methods of homology-based cloning and RACE. PaAGAP is predicted to contain a CX₂CX₁₆CX₂C type zinc finger domain and a C2 domain. Real-time PCR analysis revealed that the expression of PaAGAP was up-regulated in response to low temperature, osmotic, salt, and heavy metal stresses, indicating a potential role of PaAGAP in the plant stress response that involves the inactivation of ARF and the inhibition of polar auxin transport.
