摘要: 通过时效硬化曲线的测量、室温拉伸实验以及时效组织的电镜观察, 研究微量钪对Al-4.0Mg-1.5Cu-1.0Li-0.12Zr合金时效行为、显微组织和力学性能的影响。结果表明: 微量钪的添加能显著增强该合金的时效硬化和强化效果。微观组织分析发现, 微量钪的添加可促进 $\text{Al}_3\text{Li}/\text{Al}_3(\text{Sc}, \text{Zr})$ 复合相与 δ' 相的弥散析出。通过对合金时效过程中析出相的分析, 发现在所研究的合金中析出了Z相, 表明微量钪不是Z相析出的必要条件。

Abstract: The microstructural evolution and ageing behaviour of Al-4.0Mg-1.5Cu-1.0Li-(0.2Sc)-0.12Zr alloys were investigated. The results indicate that trace of Sc can modify the ageing characteristics of Al-4.0Mg-1.5Cu-1.0Li-0.12Zr alloys; the higher peak hardness and strength can be achieved. TEM observations show that the small addition of Sc can stimulate the precipitation of $\text{Al}_3\text{Li}/\text{Al}_3(\text{Sc}, \text{Zr})$ compound particles and δ' in the Sc-containing alloy. Z phase can be precipitated in both Sc-free and Sc-containing Al-4.0Mg-1.5Cu-1.0Li-0.12Zr alloys, and it seems that small addition of silver is not the necessary condition for the precipitation of Z phase.

Key words: aluminium-lithium alloy; microstructure; microalloying; Sc
