摘要: 采用 K_2TiF_6 和 KBF_4 混合盐原位反应法制备 $TiB_2/Al-7Si$ 复合材料, 利用XRD、SEM、金相显微镜、HV硬度测试和磨损实验等方法研究了Mg对复合材料的微观组织和力学性能的影响。结果表明: 反应生成的 TiB_2 颗粒平均尺寸约为 $0.5\mu m$, 材料的硬度和耐磨性随着 TiB_2 含量的增加而提高; 添加1.5%Mg(质量分数)元素可明显细化 TiB_2 颗粒, 且使其分布更加均匀, 增强 TiB_2 颗粒的弥散强化和细晶强化效果, 复合材料的硬度和耐磨性显著改善; 过量的Mg元素(3%)会造成 TiB_2 颗粒细化效果的下降, 但其硬度和耐磨性能继续得到改善。

Abstract: In-situ $TiB_2/Al-7Si$ composites were fabricated by K_2TiF_6 and KBF_4 compounds reaction in $Al-7Si$ melt. The effect of Mg on the microstructures and mechanical properties of $TiB_2/Al-7Si$ were investigated by using XRD, SEM, optical microscopy, hardness and wear testing techniques. The results show that TiB_2 particles with average size of about $0.5\mu m$ are produced. The hardness and wear resistance increase with increasing TiB_2 content. Adding about 1.5%Mg in melt restrains

the conglomeration of the TiB₂ particles, which makes the size of TiB₂ particle decrease and the distribution of TiB₂ particle is more homogeneous. The strengthening effect of TiB₂ particles is enhanced and the hardness and wear resistance of composites are obviously improved. The excess Mg decreases the refinement effect of TiB₂ particles, but the hardness and wear resistance are improved continuously.

Key words: TiB₂/Al-7Si composites; Mg; microstructure; hardness; mechanical properties
