器件驱动与控制

一种新型硅基OLED微显示像素电路

张新华, 陈文彬

电子科技大学 光电信息学院, 四川 成都 610054

摘要：在硅基OLED微显示器中, 为了解决很小的像素驱动电流的难题, 论文提出了一种像素电路。此像素电路由2个PMOS、2个NMOS、1个存储电容、1个OLED和4根信号线组成。并且利用HSPICE基于TSMC 0.35 μm CMOS 5 V工艺的参数进行了仿真验证。在此像素电路中, 当OLED发光时流过OLED的电流是恒定的, 并且通过控制OLED的发光时间来实现不同的灰度。此像素电路完全由数字信号控制, 能实现精确的灰度调节。通过6个子场, 实现了21级灰度, 进而论证了实现64级灰度(0~63)的可能性。当OLED发光时, 流过的恒定电流是35.3 nA。

关键词：微显示 OLED 像素电路 时间比率灰度

Novel pixel circuit for OLED-on-silicon micro-display

ZHANG Xin-hua, CHEN Wen-bin

School of Optoelectronic Information, University of Electronic Science and Technology of China, Chengdu 610054, China

Abstract: In OLED-on-silicon micro-display, how to realize a small pixel driving current is the pixel circuit's difficulty. To solve this issue, a novel pixel circuit is presented in this paper. The pixel circuit is composed of two PMOS, two NMOS, one storage capacitor, one OLED and four signal lines. This circuit is verified by HSPICE basing on TSMC 0.35 μm CMOS 5 V process. In this circuit, the current flowing through the OLED is constant when OLED is light-emitting and grayscale modulation is realized by controlling the OLED light-emitting time. This pixel circuit is fully controlled by digital signal and can achieve precise grayscale. In this paper, 21 grayscale is achieved by six sub-frames. And then 64 grayscales (from 0 to 63) can be achieved by changing signals timing. When OLED is light-emitting, the constant current is 35.3 nA.

Keywords: micro-display OLED pixel circuit time ratio grayscale
