ABSTRACT The adsorption of microorganisms in a thin layer (cylindrical pore) with the double surface rich in micropores is described, and the transport behavior of microorganisms in such a pore is discussed. It is found that the adsorption of microorganisms in such a pore is dominated by the adsorption on the double surface. The adsorption of microorganisms in such a pore is dominated by the adsorption on the double surface. The adsorption of microorganisms in such a pore is dominated by the adsorption on the double surface. The adsorption of microorganisms in such a pore is dominated by the adsorption on the double surface.

Keywords: Adsorption; Microorganisms; Transport; Cylindrical pore
