

The Concept of Quality in the Strenght Structure of the Constructions

Author(s): Răzvan Giușcă

Tomme: LIII (LVII) | **Fascicle:** 1-2 | 2007

Pages: 63-66

Abstract text:

The strength structure represents one of the main components of every construction having as main purpose to provide resistance and stability of the entire assembly. Therefore, the strength structure can be defined as the system meant to safely allow the taking over and further transmission of the loads acting on the constructions; these loads should be further transmitted to the ground. The strength structure should also create conditions for the proper functioning of the building, respecting the purposes it was first designed for.
