abstract Four land use practices were investigated for their differences in soil structural properties. The land use types are native forest, grassland, oil palm/cocoa land. Structural parameters as bulk density, total porosity, water stable aggregate (WSA) > 0.25 mm, volumetric moisture content at field capacity (FC) and wilting point (WP) content. Structural properties which are affected by land use are total porosity, water stable aggregate (WSA) > 0.25 mm, volumetric moisture content at field capacity (FC) and wilting point (WP) content.
