摘要 以‘妃子笑’荔枝果实为材料,采用抑制差减杂交(SSH)与cDNA微阵列技术相结合,研究了采后荔枝果皮褐变过程中的基因差异表达。分别以采后0 h与32 h的果皮总RNA为驱动组与检测组,构建了正向与反向SSH文库,分别获得了282个与76个阳性克隆。通过cDNA微阵列杂交筛选获得了在采后32 h果皮中上调表达克隆17个,下调表达克隆49个,分别代表了在采后32 h果皮中上调表达基因16个和下调表达基因17个,其中有较多的热激蛋白基因、糖代谢相关基因、细胞壁代谢相关基因等。

RT-PCR 检测基因表达结果与cDNA微阵列杂交结果一致。

Abstract: The differentially expressed genes between pericarp of ‘Feizixiao’ fruit at 0 h and 32 h after harvest (HAH) were identified by the combination of suppression subtractive hybridization (SSH) and cDNA microarray technology. The reciprocal, forward and reverse, SSH libraries were constructed with RNA extracted from the pericarp at 0 HAH and 32 HAH as tester and driver, respectively. Then 282 and 76 positive clones were obtained from the forward and reverse library. However, only 17 and 49 clones with enhanced or repressed expression at 32 HAH were identified by cDNA microarray hybridization, representing 16 and 17 genes both with enhanced and repressed expression in the pericarp at 32 HAH, respectively. Among the tested genes, genes encoding enzymes involved in carbohydrate metabolism, cell wall metabolism and genes encoding heat shock proteins had higher frequencies than other genes. The results of cDNA microarray hybridization were confirmed by RT-PCR.
