植物保护—研究进展

硫丹残留及其微生物降解研究进展

竺利红

浙江省农业科学院植物保护与微生物所

摘要:

硫丹是一种广泛应用的有机氯杀虫剂，其残留已造成了严重的环境污染，威胁着人类和动物的健康。笔者简述硫丹的毒性、应用概况及引起的残留现状，并分析引起硫丹残留的主要原因。利用微生物降解土壤中残留的农药是一种非常有效的方法。回顾国内外利用微生物降解硫丹的研究进展，包括降解菌种类和作用机理。为使硫丹降解菌真正实现应用，指出今后应加强高效降解菌的筛选、工程菌的构建、降解菌在污染土壤环境中的微生态学等方面的研究。

Advance on Endosulfan Residue and its Microbial Degradation

Abstract:

Endosulfan, a chlorinated pesticide of the cyclodiene group, is used extensively for the protection of cotton, tea and sugarcane crops. Endosulfan residue has led to the contamination of soil and water environments. It is also a serious threat to human and animal health. The toxicity, application situation and residue of endosulfan were introduced briefly. The residue causes were analyzed too. The degradation of pesticides in soil by microorganism was an effective method. The types of microorganism which degraded endosulfan, the mechanism of degradation were summarized in this paper. To realize a practical application of endosulfan-degrading microorganisms on fields, isolation of highly efficient degrading microorganisms, construction of genetically engineered microorganisms, environmental microbial ecosystem of degrading microorganisms should be enhanced.

Keywords: microbial degradation
