摘要 目的: 检测锌指转录因子Snail及E-钙黏附素(E-cadherin)蛋白在食管鳞癌中的表达, 分析其与食管鳞癌侵袭、转移的关系。方法: 采用免疫组织化学方法检测Snail及E-cadherin在62例食管鳞癌组织、31例癌旁不典型增生组织及62例正常食管黏膜组织中的表达, 并分析其与临床病理参数的关系。结果: 食管鳞癌组织中Snail及E-cadherin蛋白表达均与癌的组织学分级、浸润深度及淋巴结转移密切相关($P<0.05$)。在食管鳞癌癌变过程中Snail蛋白表达在癌组织、癌旁不典型增生组织及正常黏膜组织中的表达率依次降低, 分别为79.0% (49/62)、48.4% (15/31)、17.7% (11/62), 组间比较差异有统计学意义($\chi^2=50.129$, $P<0.01$)。而E-cadherin蛋白在癌组织、癌旁不典型增生组织及正常黏膜组织中的表达率依次升高, 分别为40.3% (25/62)、71.0% (22/31)、95.2% (59/62), 组间比较差异有统计学意义($\chi^2=48.426$, $P<0.01$)。进一步相关性分析表明: Snail和E-cadherin蛋白在食管鳞癌组织中的表达呈负相关。结论: Snail及E-cadherin蛋白的异常表达可能与食管鳞癌的发生、发展密切相关, 二者的联合检测有可能作为食管鳞癌侵袭、转移的重要生物学标志。

Abstract: Objective: To detect the expression of zinc finger transcript factor Snail and E-cadherin in esophageal squamous cell carcinoma(ESCC), and explore the association between those molecules and invasion and metastasis of esophageal cancer. Methods: Immunohistochemical method was used to investigate the expression of Snail and E-cadherin proteins in 62 cases of ESCC, 31 cases of adjacent atypical hyperplasia epithelium, and 62 cases of normal esophageal epithelium, and relationship between the expression of Snail and E-cadherin and the clinic pathological data in ESCC was analyzed. Results: Expression of both Snail and E-cadherin proteins were tightly associated with tissue grade, invasion depth and lymph node metastasis ($P<0.05$). In addition, the positive expression rate of Snail protein in ESCC, adjacent atypical hyperplasia epithelium and normal esophageal epithelium tissue were 79.0% (49/62), 48.4% (15/31) and 17.7% (11/62), respectively, and there was a significant difference among the 3 groups ($\chi^2=50.129$, $P<0.01$), whereas the positive expression rate of E-cadherin protein in ESCC, adjacent atypical hyperplasia epithelium and normal esophageal epithelium tissue were 40.3% (25/62), 71.0% (22/31) and 95.2% (59/62), respectively, and there was a significant difference among the 3 groups ($\chi^2=48.426$, $P<0.01$). Further correlation analysis revealed that expression of Snail and E-cadherin

appeared negative correlation in ESCC. Conclusion: Aberrant expression of Snail and E-cadherin may be closely correlated with the development and progression of ESCC, detection of combination of Snail and E-cadherin may be the important biology marker of invasion and metastasis of ESCC.

Key words: Zinc finger transcription factor Snail E-cadherin Esophageal squamous cell carcinoma
Immunohistochemistry Invasion and metastasis
