Nodular Regenerative Hyperplasia of the Liver: Report of a Case

N. Ebrahimi Daryani, H. Ghanaati, Y. Jahangiri Noudeh, B. Haghpanah, M. Bashashati, A.A. Shadman Yazdi, A. Sayyah

Abstract:

Nodular regenerative hyperplasia of the liver (NRHL) is characterized by hepatocellular nodules without fibrous septa between the nodules, and has been described in association with certain diseases. The NRHL should be considered in a liver mass and coexisting portal hypertension. We described the case of a 33-year-old Iranian man with NRHL in association with essential thrombocythemia.
