Abstract:

A 37-year-old female with a 15-year history of mitral valve replacement and a 25-year history of aortic valve replacement presented with a gradually worsening dyspnea during the last year. The chest radiograph and CT scan performed in other centers showed cardiomegaly and a mediastinal mass, for which she was referred to our department for a CT-guided transthoracic biopsy of the lesion. A contrast enhanced thoracicCT study was carried out.
