摘要:

目的: 观察长春新碱对人成骨肉瘤MG63细胞促凋亡作用, 探讨其引起细胞凋亡的分子机制。方法: 以0、5、10、20、50、100 μg/L不同浓度长春新碱处理的MG63细胞, 分别经Annexin V - PI 双染和DCFH-DA染色后, 应用流式细胞仪检测细胞凋亡和细胞内活性氧化物(ROS)水平, 用实时定量RT-PCR分析mRNA表达水平。结果: 较低浓度(10 μg/L)长春新碱即可使MG63细胞凋亡率升高至17.6%(P<0.05), 且随着长春新碱浓度的增加细胞凋亡率增加, 呈明确的剂量-效应关系; 更低浓度(5 μg/L)长春新碱即可引起细胞内ROS水平明显升高及过氧化氢酶(CAT)基因表达下调(P<0.05)。结论: 长春新碱从较低浓度起即有促进细胞凋亡作用, 其作用机制是通过下调CAT基因表达, 导致细胞内ROS异常蓄积以促进MG63细胞凋亡

Abstract:

Objective To explore the apoptosis inducing effect of vincristine on human osteosarcoma MG63 cells and clarify the molecular mechanisms. Methods The apoptosis and intracellular reactive oxygen species (ROS) level of MG63 cells were determined by flow cytometry, after incubation with Annexin V-PI and DCFH-DA which were explored on different concentrations of vincristine (0, 5, 10, 20, 50, 100 μg/L). Real-time quantitative RT-PCR was used to analyze gene expression. Results 10 μg/L vincristine could significantly increase the apoptotic rate of MG63 cells to 17.6%(P<0.05), the apoptotic rate was increased with the increasing of concentration of vincristine in a dose-dependent manner; 5 μg/L vincristine increased the intracellular ROS level and decreased the expression of CAT gene (P<0.05). Conclusion Vincristine can promote the apoptosis of MG63 cells with low concentration, its mechanism is to down-regulate the expression of CAT gene and induce the increase of ROS to promote apoptosis

Keywords: MG63; Vincristine; Apoptosis; reactive oxygen species; CAT
