Abstract:

Endometrial stromal sarcomas usually develop in the uterine corpus and occasionally arise in various extrauterine sites. Endometriosis is one of the most common benign gynecologic conditions. Malignant transformation is a rare but well-documented complication of endometriosis, occurring in 0.7% to 1% of cases. It can be the cause of some rare malignant tumors like endometrial stromal sarcoma, which is extremely rare at various extrauterine sites. Herein, we describe a surgically-proven case of bilateral endometrial stromal sarcoma originating from ovarian endometriosis in a 57-year-old woman.
