Abstract: A case of corticosteroid-dependent dermatitis with incognito facial tinea was reported. A 40-year-old man with diffused erythema, desquamation, red papules on the face, has been suffering from pruritus and burning for 7 years, who was previously diagnosed as seborrheic dermatitis, contact dermatitis, eczema, and received glucocorticoids for external use. By direct microscopy and fungal culture, the patient was diagnosed as corticosteroid-dependent dermatitis with incognito facial tinea caused by *Trichophyton rubrum*. The lesion improved evidently after two-week combined treatment (Itraconazole capsules 100 mg and pевисоне ointment twice per day during the first week, then sertaconazole twice per day for the second week). The patient was cured after consecutive four-week treatment (only topical tacrolimus ointment once daily).

Keywords: corticosteroid-dependent dermatitis incognito tinea *Trichophyton rubrum*
