Abstract:

A system and method for determining the degree of abnormality of a vital sign of a patient by obtaining the clinical profile of said patient and determining the statistical difference between the vital sign of the patient and the vital signs of previously evaluated patients having similar clinical profiles. The vital signs of previously evaluated patients having similar clinical profiles are determined based on matching the attributes of the patient's clinical profile to the clinical profiles of previously evaluated patients. The statistical difference, and the patient's clinical profile may be exported to an electronic medical record system or printed in hard copy for inclusion in the patient's medial file.
