Antrolith in the Maxillary Sinus; Report of a Case

A. Haraji, N. Mohtasham, MR. Zareh, H. Pezeshkirad

Abstract:

A case of maxillary antrolith in a 14-year-old girl is presented. A radiopaque mass, thought to be a supernumerary tooth, was incidentally found on a panoramic radiograph obtained for orthodontic purposes. During surgical exploration the maxillary sinus was penetrated and 6 calcified masses were discovered. Histopathologic analysis revealed a calcium deposition around a necrotic mass.
