ABSTRACT

The present paper describes the craniofacial form of subjects with maxillonasal dysplasia and reports its occurrence in two siblings who also have cleft palate and mandibular retrognathia. Maxillonasal dysplasia and a cleft deformity may be illustrative of a field effect of a teratogen on developing midface components or even suggestive of a possible inherited etiology.

P. Mossey is a Registrar in orthodontics at Edinburgh Dental School and Hospital

J. Sandham is Head of the Department of Orthodontics at Edinburgh Dental School and Hospital

KEY WORDS: Maxillonasal dysplasia, Mandibular retrognathia, Cleft palate, Cervical vertebral anomalies, Teratogenic activity.
