摘要 目的: 探讨脆性组氨酸三联体(FHIT)基因和p53基因在胃癌中的表达及其与临床病理因素的关系。方法: 采用免疫组化SP法检测78例胃癌组织中FHIT和p53的表达。结果: FHIT和p53在胃癌中表达率分别为43.6%和52.6%。FHIT蛋白的丢失在胃癌中占56.4%,两者与胃癌的组织类型、浸润深度、临床分期和淋巴结转移状况无关($P > 0.05$)。结论: ①胃癌组织中FHIT蛋白的丢失是频发事件,FHIT可能是胃癌发生中重要的候选抑癌基因; ②测定FHIT和p53的表达,可用于高危人群的筛选。

Abstract Purpose: To investigate the expression of fragile histidine triad(FHIT) and p53 in gastric carcinoma (GC) and their relationship to clinicopathological factors. Methods: Seventy-eight cases of GC were studied using immunohistochemical technique. Results: The positive rates of FHIT and p53 gene expression were 43.6% and 52.6% respectively. No correlation was found between the FHIT and p53 expression and their clinicopathological factors such as histological type, lymph node metastasis and staging. Conclusion: ①Loss of FHIT expression is a frequent event in GC and FHIT gene may be one of the important candidate tumor suppressor gene in carcinogenesis of GC; ②Detection of FHIT and p53 expression in biopsy specimens might be useful in screening of high-risk population.
