On isogeny classes of Edwards curves over finite fields

Omran Ahmadi and Robert Granger

Abstract: We count the number of isogeny classes of Edwards curves over finite fields, answering a question recently posed by Rezaeian and Shparlinski. We also show that each isogeny class contains a *complete* Edwards curve, and that an Edwards curve is isogenous to an *original* Edwards curve over \mathbb{F}_q if and only if its group order is divisible by 8 if $q \equiv -1 \pmod{4}$, and 16 if $q \equiv 1 \pmod{4}$. Furthermore, we give formulae for the proportion of $d \in \mathbb{F}_q \setminus \{0, 1\}$ for which the Edwards curve E_d is complete or original, relative to the total number of d in each isogeny class.
