(Received: July 24, 1996)

SUMMARY: Using a semiclassical approach, we have calculated electron–, proton–, and He III–impact line widths and shifts for 114 P IV multiplets as a function of temperature and perturber density.

1. INTRODUCTION

Stark broadening parameters of P IV lines are of interest not only for the diagnostics and modelling of various plasmas in laboratory and astrophysics, but like wise, for the research of regularities and systematic trends and various theoretical considerations. In order to provide the needed Stark broadening data, we have calculated within the semiclassical-perturbation formalism (Sahal–Bréchot, 1969ab) electron-, proton-, and doubly charged helium ion-impact line widths and shifts for 114 P IV multiplets.

2. RESULTS AND DISCUSSION

The analysis of obtained results, details of calculations and the comparison with other theoretical data will be published elsewhere (Dimitrijević and Sahal–Bréchot, 1996). Here, we present only tables of Stark broadening parameters. Our results for 114 P IV multiplets are shown in Table 1, for perturber

densities 10^{15} – 10^{20} cm $^{-3}$ and temperatures T = 5,000 – 1,000,000 K. We also specify a parameter c (Dimitrijević and Sahal–Bréchot 1984), which gives an estimate for the maximum perturber density for which the line may be treated as isolated when it is divided by the corresponding full width at half maximum. For each value given in Table 1, the collision volume (V) multiplied by the perturber density (N) is much less than one and the impact approximation is valid (Sahal–Bréchot, 1969ab). Values for NV > 0.5 are not given and values for $0.1 < NV \leq 0.5$ are denoted by an asterisk. Stark broadening parameters for densities lower than tabulated, are linear with perturber density. When the impact approximation is not valid, the ion broadening contribution may be estimated by using quasistatic approach (Sahal–Bréchot 1991 and Griem 1974). In the region between, where neither of these two approximations is valid, a unified type theory should be used. For example in Barnard et al. (1974), a simple analytical formulas for such a case is given. The accuracy of the results obtained decreases when broadening by ion interactions becomes important.

Table 1. This Table shows electron-, proton-, and He III- impact broadening parameters for P IV, for perturber densities of $10^{15} - 10^{20}$ cm $^{-3}$ and temperatures from 5,000 up to 1,000,000 K. Transitions and averaged wavelengths for the multiplet (in Å) are also given. By dividing c by the corresponding full width at half maximum (Dimitrijević *et al.*, 1991), we obtain an estimate for the maximum perturber density for which the line may be treated as isolated and tabulated data may be used. The asterisk identifies cases for which the collision volume multiplied by the perturber density (the condition for validity of the impact approximation) lies between 0.1 and 0.5. Stark broadening parameters for densities lower than tabulated, are linear with perturber density.

Претходно саопштење

Користећи семикласичан прилаз, израчунате су ширине и помераји спектралних линија, проузроковани сударима са електронима, протонима и двоструко наелектрисаним јонима

хелијума, за 114 мултиплета Р IV. Резултати су дати у функцији температуре и концентрације пертурбера.
