(Received: January 15, 1996)

**SUMMARY:** Using a semiclassical approach, we have calculated electron–, proton–, and ionized helium–impact line widths and shifts for 12 Be III and 27 B III multiplets as a function of temperature and perturber density.

## 1. INTRODUCTION

The spectral lines of lithium and beryllium are of interest not only for the abundance investigations but as well for the nucleosynthesis considerations and as an indication of the intensity of stellar thermonuclear reactions. Moreover the He-like Be III and Li-like B III spectra are particularly suitable for theoretical research, and the corresponding Stark broadening parameters are of importance not only for the consideration of Stark broadening theory but also for the examination of regularities and systematic trends within the astrophysically important helium and lithium isoelectronic sequences. In order to provide to astrophysicists the needed Stark broadening data, we have calculated within the semiclassical-perturbation formalism (Sahal–Bréchet, 1969ab) electron-, proton-, and ionized helium-impact line widths and shifts for 12 Be III and 27 B III multiplets.

## 2. RESULTS AND DISCUSSION

Analysis of obtained results and all details of calculations as well as the comparison with available experimental data will be published elsewhere (Dimitrijević and Sahal–Bréchet, 1996). Here, we present only tables of Stark broadening parameters for astrophysical and laboratory plasma diagnostic purposes. Our results for 12 Be III and 27 B III multiplets are shown in Table 1, for Be III and in Table 2 for B III, for perturber densities  $10^{17} - 10^{21} \text{ cm}^{-3}$  and temperatures  $T = 10,000 - 300,000 \text{ K}$ . We also specify a parameter  $c$  (Dimitrijević and Sahal–Bréchet 1984), which gives an estimate for the maximum perturber density for which the line may be treated as isolated when it is divided by the corresponding full width at half maximum. For each value given in Table 1, the collision volume ( $V$ ) multiplied by the perturber density ( $N$ ) is much less than one and the impact approximation is valid (Sahal–Bréchet, 1969ab).

**Table 1.** This table shows electron-, proton-, and He II- impact broadening parameters for Be III, for perturber densities  $10^{17} - 10^{21} \text{ cm}^{-3}$  and temperatures from 10,000 up to 300,000 K. Transitions and averaged wavelengths for the multiplet (in Å) are also given. By using  $c$  [see Eq. (5) in Dimitrijević et al., 1991], we obtain an estimate for the maximum perturber density for which the line may be treated as isolated and tabulated data may be used. The asterisk identifies cases for which the collision volume multiplied by the perturber density lies between 0.1 and 0.5.

PERTURBER DENSITY = $1 \times 10^{17} \text{ cm}^{-3}$

**Table 2.** This table shows electron-, proton-, and He II- impact broadening parameters for B III, for perturber densities  $10^{17} - 10^{20} \text{ cm}^{-3}$  and temperatures from 10,000 up to 300,000 K. Transitions and averaged wavelengths for the multiplet (in Å) are also given. By using  $c$  [see Eq. (5) in Dimitrijević et al., 1991], we obtain an estimate for the maximum perturber density for which the line may be treated as isolated and tabulated data may be used. The asterisk identifies cases for which the collision volume multiplied by the perturber density lies between 0.1 and 0.5.

PERTURBER DENSITY = $1 \times 10^{17} \text{ cm}^{-3}$

Values for  $NV > 0.5$  are not given and values for  $0.1 < NV \leq 0.5$  are denoted by an asterisk. When the impact approximation is not valid, the ion broadening contribution may be estimated by using quasistatic approach (Sahal-Bréchet 1991 and Griem 1974). The accuracy of the results obtained decreases when broadening by ion interactions becomes important.

The analysis of present results and comparison with available theoretical data will be published elsewhere (Dimitrijević and Sahal-Bréchet, 1996).

 Претходно саопштење

Користећи семикласичан прилаз, израчунате су ширине и помераји спектралних линија, проузроковани сударима са електронима, протонима и јонизованим хелијумом, за 12 му-

лтиплета Ве III и 27 мултиплета В III. Резултати су дати у функцији температуре и концентрације пертурбера.
