Aquatic Oligochaeta (Annelida: Clitellata) of the Department of Antioquia, Colombia, South America

Claudia Isabel Berrío-Cárdenas^{*} & Imelda Vélez

Instituto de Biología, Universidad de Antioquia, AA 1226, Medellín, Colombia. (* Author of correspondence: E-mail: ciberrioc@yahoo.com)

Key words: Aquatic Oligochaeta, Enchytraeidae, Naididae, Naidinae, Pristininae, Tubificinae, Opistocystidae, Glossoscolecidae, Lumbricidae, taxonomy, Antioquia, Colombia.

Abstract

Surveys for freshwater Oligochaeta (Annelida, Clitellata) conducted during the years 2002-2006 increase to 10 the number of species recorded from lentic and lotic habitats in the Department of Antioquia, Colombia, South America. Of the 10 species collected during this study, eight represent new records for the Department: *Dero (Aulophorus) lodeni, D. (Dero) botrytis, Nais communis, N. variabilis, Pristina aequiseta, P. macrochaeta, P. proboscidea, and P. synclites.* Two of these species, *D. botrytis* and *P. synclites,* are new records for Colombia.

Introduction

Historical studies on the aquatic Oligochaeta of Colombia include those by Wilhelm Michaelsen, who first reported the occurrence of the Pristina aequiseta Bourne, 1891, P. leidyi Smith, 1896, Slavina appendIculata Udekem, 1855 (family Naididae), Enchytraeidae (species undetermined), and Drilocrius breymanni Michaelsen, 1897 and D. burgeri Michaelsen, 1900 (family Glossoscolecidae - mega- driles) (Michaelsen, 1900, 1914, as cited in Gavrilov, 1981). Schmarda (1861) described Aeolosoma pictum (Aeolosomatidae) from the Rio Cauca basin near the city of Cali, Department of Valle del Cauca (as cited in Gavrilov, 1981). This species was later transferred to the genus Hystrichosoma by Michaelsen (1933), but is now considered a species inquirenda (Brinkhurst & Jamieson, 1971). The family Aeolosomatidae (Aphanoneura), formerly aligned with the Oligochaeta, is now aligned with the Polychaeta (Fauchald & Rouse, 1997; Rouse & Fauchald, 1997).

Several other historical records of Oligochaeta in Colombia were noted in Brinkhurst & Jamieson (1971). All megadriles in the family Glossoscolecidae, include *Periscolex profuga* (Cognetti, 1904) [as *Diporo*- chaeta profuga], Quimbaya cameliae (Michaelsen, 1914) [as Rhinodrilus (Thamnodrilus) cameliae, then Thamnodrilus cameliae], Rhinodrilus paradoxus Perrier, 1872, and Thamnodrilus gulielmi Beddard, 1887.

More recent publications reporting the presence of Oligochaeta in Colombia include Howmiller (1974), who first noted the occurrence of *Tubifex tubifex* Müller, 1774 in the city of Bogotá (department of Cundinamarca) based upon a collection he had made; Gaviria (1993), who studied the Oligochaeta fauna of the Departments of Boyacá, Casanare, Cauca, Chocó, Cundinamarca, Meta, Santander, and Valle del Cauca, and first reported the occurrence of 31 taxa in the country; and Acevedo-Pérez (1992), who first reported the occurrence of *Limnodrilus hoffmeisteri* Claparède, 1862 and *L. udekemianus* Claparède, 1862 in the Department of Antioquia.

Because the biodiversity of the region has not been evaluated extensively, our knowledge of freshwater flora and fauna occurring in Colombia is limited at best. The principal objective of this study was to identify the freshwater Oligochaeta occurring in the Department of Antioquia, Colombia.

Materials and methods

This study, conducted during the years 2002-2006, focused on the freshwater Oligochaeta fauna occurring in lentic and lotic habitats in 11 of the 125 municipalities in the Department of Antioquia (area 63,612 km²) in northwestern Colombia, one of the 32 departments in the country. Aquatic habitats sampled during this study ranged in elevation from 18 to 2500 meters above sea level (masl), and were characterized by diverse trophic conditions.

In this paper, we report the taxa found in 20 sites

located in the municipalities of Amagá (6°02'4"N, 75°42'13"W), Apartadó (7°52'4"N, 76°37'44"W), Caldas (6°05'2"N, 75°37'52"W), Chigorodó (7°39'3" N, 76°41'07"W), Don Matías (6°29'0"N, 75°23'53"W), Girardota (6°22'3"N, 75°27'08"W), Jardín (5°35'05"N, 75°50'05"W), Medellín (6°13'5"N, 75°34'05"W), Mutatá (7°14'5"N, 76°25'47"W), Santa Rosa de Osos (6°38'4"N, 75°41'40"W) and Santo Domingo (6°28'1" N, 75°10'02"W) (Fig. 1).

Fieldwork

Qualitative benthic samples were collected from substrates in the littoral zones of lentic and lotic freshwater habitats using a short hand shovel. All samples were collected from depths ranging from 0-20 cm, during the dry season as well as during periods of low to moderate precipitation. Unfixed samples (inclusive of the benthic sample, water, debris, and macrophytes) were immediately placed in plastic bags, then into chests with dry ice for transport back to the laboratory. Water samples collected at each site were also placed on dry ice in the field prior to transport back to the laboratory for analysis of hydrogen ion concentration (pH), and conductivity (μ mhos cm⁻¹). The following physical and chemical parameters were measured in the field whenever possible: oxygen concentration (mg L⁻¹) (Oxygen Test, Winkler Method); water hardness (as CaCo₃, mg L⁻¹) (Calcium Test, Titrimetric Method); current velocity (m s⁻¹); water temperature (degrees Celsius); elevation (meters above sea level – masl), geographical position (latitude / longitude coordinates) and substrate charac- terization. Anthropogenic influences such as those associated with residential and commercial buildings, cattle pastures, trash dumps, and drainages were also taken into account.

Laboratory studies

Immediately upon return to the lab, all substrate samples were transferred to an individual acrylic container, then allowed to settle, at room temperature (20° Celsius), for several weeks. The opening of each container was covered with a mesh screen (pore diameter 1 mm); all samples were oxygenated using a commercial air device; still water was added to each container periodically to maintain a standard water level. The extraction of live oligochaete specimens from each sample was performed using a stereo- microscope. The specimens were preserved in 95° ethanol, then identified after clearing and mounting in Berlese's Medium on microscope slides. Other specimens were stained with Borax Carmine, cleared in Berlese's Medium, then mounted whole for microscopical examination, identification, and illustration using a compound microscope equipped with a camera lucida system.

Taxonomic determinations were made using the keys of Brinkhurst & Jamieson (1971), Brinkhurst & Marchese (1991), and Gaviria (1993).

Specimens collected and identified during this study are deposited in the Collection of Limnology, Oligochaeta Collection (CLUA-OL), at the Institute of Biology, Faculty of Exact and Natural Sciences, University of Antioquia, Medellín, Colombia.

Taxonomy

Ten oligochaete taxa were identified from our samples: Pristina synclites and Dero (Dero) botrytis – both new records for Colombia, and Pristina aequiseta, P. macrochaeta, P. proboscidea, Nais variabilis, N. communis, and Dero (Aulophorus) lodeni – all new records for the department of Antioquia. Limnodrilus hoffmeisteri and L. udekemianus, two species previously reported from the Department of Antioquia by Acevedo-Pérez (1992), were also collected in this study.

Based on sequences of 18S rDNA and other molecular and morphological data, Erséus and Gustavsson (2002) and Erséus et al. (2002) concluded that the family Naididae is more correctly placed within a subfamily Naidinae of the Tubificidae, with 'Naididae' thus becoming a junior synonym of the family Tubificidae. A petition was then submitted by Erséus et al. (2005) to the International Commission of Zoological Nomenclature (ICZN, the Commission), requesting the family-group name Tubificidae Vejdovský, 1876, be given precedence over Naididae Ehrenberg, 1828. The Commission recently voted against this proposal, maintaining precedence for Naididae over Tubificidae (ICZN 2007); we adhere to this ruling. The subfamilies of the Tubificidae are now included within the Naididae (Erséus et al. 2008, in press).

Family Naididae Ehrenberg, 1828

Subfamily Naidinae Lastockin, 1921

Genus Dero Oken, 1815

Dero (Dero) botrytis Marcus, 1943.

Material: Collected in the municipality of Medellín. Six specimens examined.

Collection Numbers: CLUA-OL 250, 251, 252, 253, 254, 255.

Remarks: In South America, previously recorded from Brazil (Marcus, 1943), Uruguay (Cordero, 1951, as cited in Di Persia, 1980) and Argentina (Di Persia, 1980).

This is the first report of *Dero* (*Dero*) botrytis from Colombia.

Dero (Aulophorus) lodeni Brinkhurst, 1986 [=*Dero (Aulophorus) pectinatus* Stephenson, 1931; =*Dero intermedia* Loden & Harman, 1982].

Material: Collected in the municipalities of Don Matías, Medellin, and Mutatá. Ten specimens examined.

Collection Numbers: CLUA-OL 22, 24, 27, 31, 43, 48, 180, 181, 182, 189.

Remarks: Reported from Africa (Brinkhurst, 1966, as stated in Harman, 1974). In South America, recorded from Paraguay (Carter and Beadle, 1931), and Brazil (Du Bois-Reymond Marcus, 1949, as noted in Di Persia, 1980), Republic of Suriname (as 'Surinam' in Harman, 1974), and Argentina (Brinkhurst & Marchese, 1991). Recorded from Colombia

by Gaviria (1993). This is the first report of *Dero* (*Aulophorus*) *lodeni* for the Department of Antioquia.

Genus Nais Müller, 1773

Nais communis Piguet, 1906.

Material: Collected in the municipality of Don Matías. Two specimens examined.

Collection Numbers: CLUA-OL 39, 49.

Remarks: Cosmopolitan. In Central America, reported from Guatemala (Howmiller, 1974), and Costa Rica (Harman, 1982). In South America, recorded from Peru by Piguet (1928), Argentina (Michaelsen & Boldt, 1932), Brazil (Marcus, 1943) (as noted in Di Persia, 1980), Ecuador (Coates & Stacey, 1994). Previously reported for Colombia by Gaviria (1993). This is the first report of *Nais communis* for the Department of Antioquia.

Nais variabilis Piguet, 1906.

Material: Collected in the municipalities of Don Matías and Jardín. Nine specimens examined.

Collection Numbers: CLUA-OL 35, 45, 50, 71, 140, 141, 143, 145, 146.

Remarks: Cosmopolitan. In South America, recorded from Perú (Piguet, 1928), Argentina (Cernosvitov, 1937, as cited in Di Persia, 1980), Bolivia (Brinkhurst & Marchese, 1991) and Brazil (Takeda et al., 2000). Previously recorded from Colombia by Gaviria (1993). This is the first report of *Nais variabilis* for the Department of Antioquia.

Subfamily Pristininae Lastockin, 1921

Genus Pristina Ehrenberg, 1828

Pristina aequiseta Bourne, 1891.

Material: Collected from sites located in the municipality of Don Matías. Six specimens examined. *Collection Numbers:* CLUA-OL 59, 60, 62, 63, 64.

Remarks: Cosmopolitan. In South America, previously reported for Brazil (Marcus, 1943), Surinam (Harman, 1974), Bolivia, Peru, Argentina, Chile (as cited in Brinkhurst & Marchese, 1991), and Ecuador (Coates & Stacey, 1994). Previously reported for Colombia by Michaelsen (1914, as stated in Gavrilov, 1981). This is the first record for the Department of Antioquia.

Pristina macrochaeta Stephenson, 1931.

Material: Collected from sites located in the municipalities of Chigorodó and Mutatá. Six specimens examined.

Collection Numbers: CLUA-OL 28, 29, 30, 32, 184, 185.

Remarks: Previously known from Afghanistan (as stated in Brinkhurst & Jamieson, 1971). In South America (as stated in Di Persia, 1980), originally described from Paraguay by Stephenson (1931), and soon after reported from Paraguay (Carter & Beadle, 1931); also reported from Brazil (Marcus, 1943), Uruguay (Cordero, 1951). Reported for Surinam (Harman, 1974), Argentina (Di Persia, 1980), and Colombia (Gaviria, 1993). This is the first report of *Pristina macrochaeta* for the Department of Antioquia.

Pristina proboscidea Beddard, 1896.

Material: Collected from sites located in the municipalities of Caldas, Chigorodó, Jardín, and Mutatá. Nine individuals examined.

Collection Numbers: CLUA-OL 1, 4, 7, 17, 21, 23, 127, 128, 129.

Remarks: Reported from south and east Asia, Australia, and Zanzibar (Brinkhurst & Jamieson, 1971, and Harman, 1974). In South America, previously reported (as noted in Di Persia, 1980): from Chile (Beddard, 1896), Paraguay (Michaelsen, 1905), Argentina (Cernosvitov, 1937), Brazil (Marcus, 1943), and Surinam (Harman (1974). Previously reported from Colombia by Gaviria (1993). This is the first report of *Pristina proboscidea* for the Department of Antioquia.

Pristina synclites Stephenson, 1925.

Material: Collected in the municipality of Santo Domingo.

Ten specimens examined.

Collection Numbers: CLUA-OL 121, 122, 123, 124, 152, 155, 156, 157, 158, 159.

Remarks: Recorded from Africa, India (as cited in Brinkhurst & Jamieson, 1971), and Indonesia (Ohtaka et al., 2000). In South America, previously reported from Argentina (Brinkhurst & Marchese, 1991), Ecuador (Coates & Stacey, 1994) and Brazil (Takeda et al., 2000). This is the first report of *Pristina synclites* from Colombia.

Subfamily Tubificinae Vejdovský, 1876

Genus Limnodrilus Claparède, 1862

Limnodrilus hoffmeisteri Claparède, 1862.

Material: Collected from sites located in the municipalities of Don Matías, Medellín, Santa Rosa de Osos, Santo Domingo. Seven mature individuals were examined.

Collection Numbers: CLUA-OL 74, 125, 126, 168, 169, 171, 176.

Remarks: Cosmopolitan (Brinkhurst & Jamieson, 1971). In South America, previously reported for Argentina (Cernosvitov, 1939), Perú (Cernosvitov, 1939), and Brazil (Marcus, 1942), as stated in Di Persia (1980). Previously reported for Colombia by Gaviria (1993).

Limnodrilus udekemianus Claparède, 1862.

Material: Collected from sites located in the municipality of Girardota. One mature individual examined.

Collection Number: CLUA-OL 270.

Remarks: Cosmopolitan. In South America, previously reported for Brazil (Marcus, 1942), as noted in Gavrilov (1981), Argentina (Gavrilov & Paz, 1949, as stated in Di Persia, 1980) and Peru, (Brinkhurst & Marchese, 1991). Previously reported for Colombia by Gaviria (1993).

Discussion

Prior to this study, 37 oligochaete species had been recorded from Colombia (Table 1), yet only two - Limnodrilus hoffmeisteri and Limnodrilus udekemianus (Naididae, Tubificinae) – had previously been reported for the Department of Antioquia (Acevedo-Pérez, 1992); both of these taxa were collected during this present study (Table 1).

Two Naididae species collected during this study – Dero (Dero) botrytis and Pristina synclites – represent new records for Colombia; six other naidid species collected during this study – Dero (Aulophorus) lodeni, Nais communis, and N. variabilis (subfamily Naidinae), Pristina aequiseta, Pristina macrochaeta, and P. proboscidea (Subfamily Pristininae) represent new records for Antioquia (Table 1).

Dero (*Aulophorus*) *lodeni* was collected in a broad altitudinal range (55-2110 masl) in warm waters (28.9°C). *Dero* (*Dero*) *botrytis* was collected from one unique site, an artificial pond. *Nais variabilis* was found at sites in Jardín and Don Matías, Antioquia, with oxygen concentrations ranging from 1.5 mg L⁻¹ to 9.5 mg L⁻¹.

The genus *Pristina* was the most abundant in the present study. *Pristina proboscidea* was the more eurithermic (16-28.9 °C) and ubiquitous species (altitudinal range, 55-2500 masl; pH, 5-9). *Pristina synclites*, however, was collected from only one site – from the loose mud at the littoral zone of a eutrophic reservoir in the Municipality of Santo Domingo (altitudinal range, 955-1250 masl).

The absence of aquatic oligochaetes from some areas surveyed during this study could be attributed to 1) poor water quality: vis., very high conductivity (439 μ mhos cm⁻¹) values measured at one sampling site in the municipality of Apartadó), and/or 2) lack of specific habitat associations (substrate, vegetation).

Aknowledgments

We extend our appreciation to Centro de Investigaciones de la Facultad de Ciencias Exactas y Naturales (CIEN) and Comité de Evaluación de Investigación (CODI) – both affíliated with the Universidad de Antioquia, for financial support of this research. We are indebted to numerous colleagues for their support and guidance during the course of this research: Dr. J. J. Ramírez, Limnology (Biology Institute University of Antioquia) for his valuable advice and suggestions on the limnological aspects of our study; Drs. P. Rodríguez, T. Timm, A. Ohtaka, S. Fend, and P. Martin for their invaluable taxonomic advice; and M. J. Wetzel (Illinois Natural History Survey, Champaign, IL, U.S.A.) and an anonymous reviewer for constructive comments and suggestions during the preparation of this manuscript. The preliminary results of this study were presented at the 10th International Symposium on Aquatic Oligochaeta in Wuhan, China, October 2006; we extend our appreciation to the convener of the symposium, Dr. H. Wang (Institute of Hydrobiology, Chinese Academy of Sciences) and to the symposium co-chairs Drs. Y. Liang and C. Erséus for their invitation to present this research. Fundación Para La Promoción de la Ciencia y la Tecnología del Banco de La República de Colombia kindly provided additional funding for travel to China so Berrio-Cárdenas could present this research.
