*Received:* 21 November, 2007

*Accepted:* 10 July, 2008

*Communicated by:* [S.S. Dragomir](#)

*2000 AMS Sub. Class.:* 26D10, 26D15.

*Key words:* Integral inequality; retarded; nonlinear; explicit bound.

*Abstract:* In this paper some new retarded integral inequalities are established and explicit bounds on the unknown functions are derived. The present results extend some existing ones proved by Lipovan in [A retarded integral inequality and its applications, J. Math. Anal. Appl. 285 (2003) 436-443].

*Acknowledgement:* The research was jointly supported by grants from the National Natural Science Foundation of China (No. 50578064) and the Natural Science Foundation of Guangdong Province, China (No.06025219).

## 1. Introduction

During the past decades, studies on integral inequalities have been greatly enriched by the recognition of their potential applications in various applied sciences [1] – [6]. Recently, integral inequalities with delays have received much attention from researchers [7] – [12]. In this paper, we establish some new retarded integral inequalities and derive explicit bounds on unknown functions, the results of which improve some known ones in [9].

## 2. Main Results

Throughout the paper,  $\mathbb{R}$  denotes the set of real numbers and  $\mathbb{R}_+ = [0, +\infty)$ .  $C(M, S)$  denotes the class of all continuous functions from  $M$  to  $S$ .  $C^1(M, S)$  denotes the class of functions with continuous first derivative.

**Theorem 2.1.** *Suppose that  $p > q \geq 0$  and  $c \geq 0$  are constants, and  $u, f, g, h \in C(\mathbb{R}_+, \mathbb{R}_+)$ . Let  $w \in (\mathbb{R}_+, \mathbb{R}_+)$  be nondecreasing with  $w(u) > 0$  on  $(0, \infty)$ , and  $\alpha \in C^1(\mathbb{R}_+, \mathbb{R}_+)$  be nondecreasing with  $\alpha(t) \leq t$  on  $\mathbb{R}_+$ . Then the following integral inequality*

$$(2.1) \quad u^p(t) \leq c^2 + 2 \int_0^{\alpha(t)} \left[ f(s)u^q(s) \left( \int_0^s g(\tau)w(u(\tau))d\tau \right) + h(s)u^q(s) \right] ds, \quad t \in \mathbb{R}_+$$

implies for  $0 \leq t \leq T$ ,

$$(2.2) \quad u(t) \leq \left\{ G^{-1} \left[ G(\xi(t)) + \frac{2(p-q)}{p} \int_0^{\alpha(t)} f(s) \int_0^s g(\tau)d\tau ds \right] \right\}^{\frac{1}{p-q}}$$

holds, where

$$(2.3) \quad \xi(t) = c^{\frac{2(p-q)}{p}} + \frac{2(p-q)}{p} \int_0^{\alpha(t)} h(s)ds,$$

$$(2.4) \quad G(r) = \int_{r_0}^r \frac{1}{w\left(s^{\frac{1}{p-q}}\right)} ds, \quad r \geq r_0 > 0,$$

Close

$G^{-1}$  denotes the inverse function of  $G$ , and  $T \in \mathbb{R}_+$  is chosen so that

$$G(\xi(t)) + \frac{2(p-q)}{p} \int_0^{\alpha(t)} f(s) \int_0^s g(\tau) d\tau ds \in \text{Dom}(G^{-1}), \quad \text{for all } 0 \leq t \leq T.$$

*Proof.* The conditions  $\alpha \in C^1(\mathbb{R}_+, \mathbb{R}_+)$  and  $\alpha(t) \leq t$  imply that  $\alpha(0) = 0$ . Firstly we assume that  $c > 0$ . Define the nondecreasing positive function  $z(t)$  by

$$z(t) := c^2 + 2 \int_0^{\alpha(t)} \left[ f(s) u^q(s) \left( \int_0^s g(\tau) w(u(\tau)) d\tau \right) + h(s) u^q(s) \right] ds.$$

Then  $z(0) = c^2$  and by (2.1) we have

$$(2.5) \quad u(t) \leq [z(t)]^{\frac{1}{p}},$$

and consequently  $u(\alpha(t)) \leq [z(\alpha(t))]^{\frac{1}{p}} \leq [z(t)]^{\frac{1}{p}}$ . By differentiation we get

$$\begin{aligned} z'(t) &= 2u^q(\alpha(t)) \left[ f(\alpha(t)) \left( \int_0^{\alpha(t)} g(\tau) w(u(\tau)) d\tau \right) + h(\alpha(t)) \right] \alpha'(t) \\ &\leq 2 [z(t)]^{\frac{q}{p}} \left[ f(\alpha(t)) \left( \int_0^{\alpha(t)} g(\tau) w(u(\tau)) d\tau \right) + h(\alpha(t)) \right] \alpha'(t). \end{aligned}$$

Hence

$$\frac{z'(t)}{[z(t)]^{\frac{q}{p}}} \leq 2f(\alpha(t))\alpha'(t) \int_0^{\alpha(t)} g(\tau) w(u(\tau)) d\tau + 2h(\alpha(t))\alpha'(t).$$

Integrating both sides of last relation on  $[0, t]$  yields

$$\frac{p}{p-q} [z(t)]^{\frac{p-q}{p}} \leq \frac{p}{p-q} [z(0)]^{\frac{p-q}{p}} + 2 \int_0^{\alpha(t)} h(s) ds + 2 \int_0^{\alpha(t)} f(s) \int_0^s g(\tau) w(u(\tau)) d\tau ds,$$

[Title Page](#)[Contents](#)

Page 6 of 20

[Go Back](#)[Full Screen](#)[Close](#)

which can be rewritten as

$$(2.6) \quad [z(t)]^{\frac{p-q}{p}} \leq c^{\frac{2(p-q)}{p}} + \frac{2(p-q)}{p} \int_0^{\alpha(t)} h(s) ds \\ + \frac{2(p-q)}{p} \int_0^{\alpha(t)} f(s) \int_0^s g(\tau) w(u(\tau)) d\tau ds.$$

Let  $T_1 (\leq T)$  be an arbitrary number. For  $0 \leq t \leq T_1$ , from (2.3) and (2.6) we have

$$(2.7) \quad [z(t)]^{\frac{p-q}{p}} \leq \xi(T_1) + \frac{2(p-q)}{p} \int_0^{\alpha(t)} f(s) \int_0^s g(\tau) w(u(\tau)) d\tau ds.$$

Denoting the right-hand side of (2.7) by  $m(t)$ , we know  $u(t) \leq [z(t)]^{\frac{1}{p}} \leq [m(t)]^{\frac{1}{p-q}}$ . Since  $w$  is nondecreasing, we obtain

$$w[u(\tau)] \leq w \left[ (z(\tau))^{\frac{1}{p}} \right] \leq w \left[ (z(\alpha(t)))^{\frac{1}{p}} \right] \leq w \left[ (z(t))^{\frac{1}{p}} \right], \quad \text{for } \tau \in [0, \alpha(t)].$$

Hence

$$m'(t) = \frac{2(p-q)}{p} f(\alpha(t)) \alpha'(t) \int_0^{\alpha(t)} g(\tau) w(u(\tau)) d\tau \\ \leq \frac{2(p-q)}{p} w \left[ (z(t))^{\frac{1}{p}} \right] f(\alpha(t)) \alpha'(t) \int_0^{\alpha(t)} g(\tau) d\tau \\ \leq \frac{2(p-q)}{p} w \left[ (m(t))^{\frac{1}{p-q}} \right] f(\alpha(t)) \alpha'(t) \int_0^{\alpha(t)} g(\tau) d\tau.$$

That is

$$(2.8) \quad \frac{m'(t)}{w \left[ (m(t))^{\frac{1}{p-q}} \right]} \leq \frac{2(p-q)}{p} f(\alpha(t)) \alpha'(t) \int_0^{\alpha(t)} g(\tau) d\tau.$$

[Title Page](#)[Contents](#)[◀◀](#) [▶▶](#)[◀](#) [▶](#)

Page 7 of 20

[Go Back](#)[Full Screen](#)[Close](#)

Integrating both sides of the last inequality on  $[0, t]$  and using the definition (2.4), we get

$$(2.9) \quad G(m(t)) - G(m(0)) \leq \frac{2(p-q)}{p} \int_0^{\alpha(t)} f(s) \int_0^s g(\tau) d\tau ds.$$

Taking  $t = T_1$  in inequality (2.9) and using  $u(t) \leq [m(t)]^{\frac{1}{p-q}}$ , we have

$$u(T_1) \leq \left\{ G^{-1} \left[ G[\xi(T_1)] + \frac{2(p-q)}{p} \int_0^{\alpha(T_1)} f(s) \int_0^s g(\tau) d\tau ds \right] \right\}^{\frac{1}{p-q}}.$$

Since  $T_1 (\leq T)$  is arbitrary, we have proved the desired inequality (2.2).

The case  $c = 0$  can be handled by repeating the above procedure with  $\varepsilon > 0$  instead of  $c$  and subsequently letting  $\varepsilon \rightarrow 0$ . This completes the proof.  $\square$

*Remark 1.* If  $c = 0$  and  $h(t) \equiv 0$  hold,  $G(\xi(t)) = G(0)$  in (2.4) is not defined. In such a case, the upper bound on solutions of the integral inequality (2.1) can be calculated as

$$u(t) \leq \lim_{\varepsilon \rightarrow 0^+} \left\{ G^{-1} \left[ G(\varepsilon) + \frac{2(p-q)}{p} \int_0^{\alpha(t)} f(s) \int_0^s g(\tau) d\tau ds \right] \right\}^{\frac{1}{p-q}}.$$

From Theorem 2.1, we can easily derive the following corollaries.

**Corollary 2.2.** Suppose that  $u, h \in C(\mathbb{R}_+, \mathbb{R}_+)$  and  $c \geq 0$  is a constant. Let  $\alpha \in C^1(\mathbb{R}_+, \mathbb{R}_+)$  be nondecreasing with  $\alpha(t) \leq t$  on  $\mathbb{R}_+$ . Then the following inequality

$$u^2(t) \leq c^2 + 2 \int_0^{\alpha(t)} h(s)u(s)ds,$$

[Title Page](#)[Contents](#)[◀◀](#) [▶▶](#)[◀](#) [▶](#)

Page 8 of 20

[Go Back](#)[Full Screen](#)[Close](#)

implies

$$u(t) \leq c + \int_0^{\alpha(t)} h(s) ds.$$

**Remark 2.** If  $\alpha(t) \equiv t$ , from Corollary 2.2 we get the Ou-Iang inequality.

**Corollary 2.3.** Suppose that  $u, f, g, h \in C(\mathbb{R}_+, \mathbb{R}_+)$ , and  $c \geq 0$  is a constant. Let  $w \in C^1(\mathbb{R}_+, \mathbb{R}_+)$  be nondecreasing with  $w(u) > 0$  on  $(0, \infty)$ , and  $\alpha \in C^1(\mathbb{R}_+, \mathbb{R}_+)$  be nondecreasing with  $\alpha(t) \leq t$  on  $\mathbb{R}_+$ . Then the following inequality

$$u^2(t) \leq c^2 + 2 \int_0^{\alpha(t)} \left[ f(s)u(s) \left( \int_0^s g(\tau)u(\tau) d\tau \right) + h(s)u(s) \right] ds$$

implies

$$u(t) \leq \xi(t) \exp \left( \int_0^{\alpha(t)} f(s) \left( \int_0^s g(\tau) d\tau \right) ds \right)$$

where  $\xi(t) = c + \int_0^{\alpha(t)} h(s) ds$ .

**Theorem 2.4.** Suppose that  $p > q \geq 0$  and  $c \geq 0$  are constants, and  $u, f, g, h \in C(\mathbb{R}_+, \mathbb{R}_+)$ . Let  $w \in C^1(\mathbb{R}_+, \mathbb{R}_+)$  be nondecreasing with  $w(u) > 0$  on  $(0, \infty)$ , and  $\alpha \in C^1(\mathbb{R}_+, \mathbb{R}_+)$  be nondecreasing with  $\alpha(t) \leq t$  on  $\mathbb{R}_+$ . Then the following integral inequality

$$(2.10) \quad u^p(t) \leq c^2 + 2 \int_0^{\alpha(t)} \left[ f(s)u^q(s) \left( w(u(s)) + \int_0^s g(\tau)w(u(\tau)) d\tau \right) + h(s)u^q(s) \right] ds, \quad t \in \mathbb{R}_+$$

Title Page

implies for  $0 \leq t \leq T$

$$(2.11) \quad u(t) \leq \left\{ G^{-1} \left[ G(\xi(t)) + \frac{2(p-q)}{p} \int_0^{\alpha(t)} f(s) \left( 1 + \int_0^s g(\tau) d\tau \right) ds \right] \right\}^{\frac{1}{p-q}},$$

where  $\xi(t)$  and  $G(r)$  are defined by (2.3) and (2.4), respectively, and  $T \in \mathbb{R}_+$  is chosen so that

$$G(\xi(t)) + \frac{2(p-q)}{p} \int_0^{\alpha(t)} f(s) \left( 1 + \int_0^s g(\tau) d\tau \right) ds \in \text{Dom} (G^{-1}), \text{ for all } 0 \leq t \leq T.$$

*Proof.* Firstly we assume that  $c > 0$ . Define the nondecreasing positive function by

$$z(t) := c^2 + 2 \int_0^{\alpha(t)} \left[ f(s) u^q(s) \left( w(u(s)) + \int_0^s g(\tau) w(u(\tau)) d\tau \right) + h(s) u^q(s) \right] ds,$$

then  $z(0) = c^2$  and by (2.10) we have

$$(2.12) \quad u(t) \leq [z(t)]^{\frac{1}{p}},$$

and

$$\begin{aligned} z'(t) &= 2u^q(\alpha(t)) \left[ f(\alpha(t)) \left( w(u(\alpha(t))) + \int_0^{\alpha(t)} g(\tau) w(u(\tau)) d\tau \right) + h(\alpha(t)) \right] \alpha'(t) \\ &\leq 2 [z(t)]^{\frac{q}{p}} \left[ f(\alpha(t)) \left( w(u(\alpha(t))) + \int_0^{\alpha(t)} g(\tau) w(u(\tau)) d\tau \right) + h(\alpha(t)) \right] \alpha'(t). \end{aligned}$$

Hence

$$\frac{z'(t)}{[z(t)]^{\frac{q}{p}}} \leq 2h(\alpha(t))\alpha'(t) + 2f(\alpha(t))\alpha'(t) \left( w(u(\alpha(t))) + \int_0^{\alpha(t)} g(\tau) w(u(\tau)) d\tau \right).$$

Integrating both sides of the last inequality on  $[0, t]$ , we get

$$\frac{p}{p-q} [z(t)]^{\frac{p-q}{p}} \leq \frac{p}{p-q} [z(0)]^{\frac{p-q}{p}} + 2 \int_0^{\alpha(t)} h(s) ds + 2 \int_0^{\alpha(t)} f(s) \left( w(u(s)) + \int_0^s g(\tau) w(u(\tau)) d\tau \right) ds.$$

Using (2.3), we get

$$[z(t)]^{\frac{p-q}{p}} \leq \xi(t) + \frac{2(p-q)}{p} \int_0^{\alpha(t)} f(s) \left( w(u(s)) + \int_0^s g(\tau) w(u(\tau)) d\tau \right) ds.$$

Let  $T_1 (\leq T)$  be an arbitrary number. From last inequality we know the following relation holds for  $t \in [0, T_1]$ ,

$$[z(t)]^{\frac{p-q}{p}} \leq \xi(T_1) + \frac{2(p-q)}{p} \int_0^{\alpha(t)} f(s) \left( w(u(s)) + \int_0^s g(\tau) w(u(\tau)) d\tau \right) ds.$$

Letting

$$(2.13) \quad m(t) = \xi(T_1) + \frac{2(p-q)}{p} \int_0^{\alpha(t)} f(s) \left( w(u(s)) + \int_0^s g(\tau) w(u(\tau)) d\tau \right) ds,$$

we get  $[z(t)]^{\frac{p-q}{p}} \leq m(t)$ . Since  $w$  is nondecreasing, we have

$$w[u(\alpha(t))] \leq w \left[ (z(\alpha(t)))^{\frac{1}{p}} \right] \leq w \left[ (z(t))^{\frac{1}{p}} \right] \leq w \left[ (m(t))^{\frac{1}{p-q}} \right]$$

and

$$w[u(\tau)] \leq w \left[ (z(\tau))^{\frac{1}{p}} \right] \leq w \left[ (z(\alpha(t)))^{\frac{1}{p}} \right] \leq w \left[ (z(t))^{\frac{1}{p}} \right], \quad \text{for } \tau \in [0, \alpha(t)].$$

From (2.13), by differentiation we obtain

$$\begin{aligned} m'(t) &= \frac{2(p-q)}{p} f(\alpha(t)) \left( w(u(\alpha(t))) + \int_0^{\alpha(t)} g(\tau) w(u(\tau)) d\tau \right) \alpha'(t) \\ &\leq \frac{2(p-q)}{p} f(\alpha(t)) \left\{ w\left([m(t)]^{\frac{1}{p-q}}\right) + \int_0^{\alpha(t)} g(\tau) w\left([m(t)]^{\frac{1}{p-q}}\right) d\tau \right\} \alpha'(t) \\ &= w\left([m(t)]^{\frac{1}{p-q}}\right) \frac{2(p-q)}{p} f(\alpha(t)) \left( 1 + \int_0^{\alpha(t)} g(\tau) d\tau \right) \alpha'(t). \end{aligned}$$

Hence

$$\frac{m'(t)}{w\left([m(t)]^{\frac{1}{p-q}}\right)} \leq \frac{2(p-q)}{p} f(\alpha(t)) \left( 1 + \int_0^{\alpha(t)} g(\tau) d\tau \right) \alpha'(t).$$

Integrating both sides of the last inequality on  $[0, t]$ , from (2.4) we get

$$G(m(t)) \leq G(m(0)) + \frac{2(p-q)}{p} \int_0^{\alpha(t)} f(s) \left( 1 + \int_0^s g(\tau) d\tau \right) ds.$$

Hence

$$(2.14) \quad m(t) \leq G^{-1} \left[ G(\xi(T_1)) + \frac{2(p-q)}{p} \int_0^{\alpha(t)} f(s) \left( 1 + \int_0^s g(\tau) d\tau \right) ds \right].$$

Taking  $t = T_1$  in inequality (2.14) and using  $u(t) \leq [m(t)]^{\frac{1}{p-q}}$ , we have

$$u(T_1) \leq \left\{ G^{-1} \left[ G(\xi(T_1)) + \frac{2(p-q)}{p} \int_0^{\alpha(T_1)} f(s) \left( 1 + \int_0^s g(\tau) d\tau \right) ds \right] \right\}^{\frac{1}{p-q}}.$$

[Title Page](#)[Contents](#)

Page 12 of 20

[Go Back](#)[Full Screen](#)[Close](#)

Since  $T_1(\leq T)$  is arbitrary we have proved the desired inequality (2.11).

If  $c = 0$ , the result can be proved by repeating the above procedure with  $\varepsilon > 0$  instead of  $c$  and subsequently letting  $\varepsilon \rightarrow 0$ . This completes the proof.  $\square$

*Remark 3.* Theorem 2.1 of Lipovan in [9] is special case of above Theorem 2.4, under the assumptions that  $p = 2$ ,  $q = 1$  and  $g(t) \equiv 0$ .

**Theorem 2.5.** *Suppose that  $p > q \geq 0$  and  $c \geq 0$  are constants, and  $u, f, g, h \in C(\mathbb{R}_+, \mathbb{R}_+)$ . Let  $w \in (\mathbb{R}_+, \mathbb{R}_+)$  be nondecreasing with  $w(u) > 0$  on  $(0, \infty)$ , and  $\alpha, \beta \in C^1(\mathbb{R}_+, \mathbb{R}_+)$  be nondecreasing with  $\alpha(t) \leq t$ ,  $\beta(t) \leq t$  on  $\mathbb{R}_+$ . Then the following integral inequality*

$$(2.15) \quad u^p(t) \leq c^2 + 2 \int_0^{\alpha(t)} \left[ f(s)u^q(s) \left( w(u(s)) + \int_0^s g(\tau)w(u(\tau))d\tau \right) \right] ds \\ + 2 \int_0^{\beta(t)} h(s)u^q(s)w(u(s))ds, \quad t \in \mathbb{R}_+$$

implies for  $0 \leq t \leq T$

$$(2.16) \quad u(t) \leq \left\{ G^{-1} \left[ G(c^{\frac{2(p-q)}{p}}) + \frac{2(p-q)}{p} \int_0^{\alpha(t)} f(s) \left( 1 + \int_0^s g(\tau)d\tau \right) ds \right. \right. \\ \left. \left. + \frac{2(p-q)}{p} \int_0^{\beta(t)} h(s)ds \right] \right\}^{\frac{1}{p-q}},$$

where  $G(r)$  is defined by (2.4) and  $T \in \mathbb{R}_+$  is chosen so that

Title Page

Contents

Close

$$G \left( c^{\frac{2(p-q)}{p}} \right) + \frac{2(p-q)}{p} \int_0^{\alpha(t)} f(s) \left( 1 + \int_0^s g(\tau) d\tau \right) ds \\ + \frac{2(p-q)}{p} \int_0^{\beta(t)} h(s) ds \in \text{Dom} (G^{-1}), \quad \text{for all } 0 \leq t \leq T.$$

*Proof.* The conditions that  $\alpha, \beta \in C^1(\mathbb{R}_+, \mathbb{R}_+)$  are nondecreasing with  $\alpha(t) \leq t$ ,  $\beta(t) \leq t$  imply that  $\alpha(0) = 0$  and  $\beta(0) = 0$ .

Let us first assume that  $c > 0$ . Denoting the right-hand side of (2.15) by  $z(t)$ , we know  $z(t)$  is nondecreasing,  $z(0) = c^2$  and  $u(t) \leq [z(t)]^{\frac{1}{p}}$ . Consequently we have

$$u(\alpha(t)) \leq [z(\alpha(t))]^{\frac{1}{p}} \leq [z(t)]^{\frac{1}{p}} \quad \text{and} \quad u(\beta(t)) \leq [z(\beta(t))]^{\frac{1}{p}} \leq [z(t)]^{\frac{1}{p}}.$$

Since  $w$  is nondecreasing, we obtain

$$z'(t) = 2f(\alpha(t))u^q(\alpha(t)) \left( w(u(\alpha(t))) + \int_0^{\alpha(t)} g(\tau)w(u(\tau))d\tau \right) \alpha'(t) \\ + 2h(\beta(t))u^q(\beta(t))w(u(\beta(t)))\beta'(t) \\ \leq 2[z(t)]^{\frac{q}{p}} [f(\alpha(t)) \left( w(u(\alpha(t))) + \int_0^{\alpha(t)} g(\tau)w(u(\tau))d\tau \right) \alpha'(t) \\ + h(\beta(t))w(u(\beta(t)))\beta'(t)].$$

Hence

$$\frac{z'(t)}{[z(t)]^{\frac{q}{p}}} \leq 2f(\alpha(t)) \left( w(u(\alpha(t))) + \int_0^{\alpha(t)} g(\tau)w(u(\tau))d\tau \right) \alpha'(t) \\ + 2h(\beta(t))w(u(\beta(t)))\beta'(t).$$

Integrating both sides on  $[0, t]$ , we get

$$\begin{aligned} \frac{p}{p-q} [z(t)]^{\frac{p-q}{p}} &\leq \frac{p}{p-q} [z(0)]^{\frac{p-q}{p}} \\ &+ 2 \int_0^{\alpha(t)} f(s) \left( w(u(s)) + \int_0^s g(\tau)w(u(\tau))d\tau \right) ds \\ &+ 2 \int_0^{\beta(t)} h(s)w(u(s)) ds, \end{aligned}$$

which can be rewritten as

$$\begin{aligned} (2.17) \quad [z(t)]^{\frac{p-q}{p}} &\leq c^{\frac{2(p-q)}{p}} \\ &+ \frac{2(p-q)}{p} \int_0^{\alpha(t)} f(s) \left( w(u(s)) + \int_0^s g(\tau)w(u(\tau))d\tau \right) ds \\ &+ \frac{2(p-q)}{p} \int_0^{\beta(t)} h(s)w(u(s)) ds. \end{aligned}$$

Denoting the right-hand side of (2.17) by  $m(t)$ , we know  $[z(t)]^{\frac{p-q}{p}} \leq m(t)$  and

$$\begin{aligned} m'(t) &= \frac{2(p-q)}{p} f(\alpha(t)) \left( w(u(\alpha(t))) + \int_0^{\alpha(t)} g(\tau)w(u(\tau))d\tau \right) \alpha'(t) \\ &+ \frac{2(p-q)}{p} h(\beta(t)) w(u(\beta(t))) \beta'(t) \\ &\leq \frac{2(p-q)}{p} f(\alpha(t)) \left( w\left(z^{\frac{1}{p}}(\alpha(t))\right) + \int_0^{\alpha(t)} g(\tau)w\left(z^{\frac{1}{p}}(\tau)\right) d\tau \right) \alpha'(t) \\ &+ \frac{2(p-q)}{p} h(\beta(t)) w\left(z^{\frac{1}{p}}(\beta(t))\right) \beta'(t) \end{aligned}$$

[Title Page](#)[Contents](#)

Page 15 of 20

[Go Back](#)[Full Screen](#)[Close](#)

$$\begin{aligned} &\leq w\left(z^{\frac{1}{p}}(t)\right) \frac{2(p-q)}{p} \left[ f(\alpha(t)) \left( 1 + \int_0^{\alpha(t)} g(\tau) d\tau \right) \alpha'(t) + h(\beta(t)) \beta'(t) \right] \\ &\leq w\left(m^{\frac{1}{p-q}}(t)\right) \frac{2(p-q)}{p} \left[ f(\alpha(t)) \left( 1 + \int_0^{\alpha(t)} g(\tau) d\tau \right) \alpha'(t) + h(\beta(t)) \beta'(t) \right]. \end{aligned}$$

The above relation gives

$$\frac{m'(t)}{w\left(m^{\frac{1}{p-q}}(t)\right)} \leq \frac{2(p-q)}{p} \left[ f(\alpha(t)) \left( 1 + \int_0^{\alpha(t)} g(\tau) d\tau \right) \alpha'(t) + h(\beta(t)) \beta'(t) \right].$$

Integrating both sides on  $[0, t]$  and using definition (2.4) we get

$$\begin{aligned} &G(m(t)) \\ &\leq G(m(0)) + \frac{2(p-q)}{p} \left[ \int_0^{\alpha(t)} f(s) \left( 1 + \int_0^s g(\tau) d\tau \right) ds + \int_0^{\beta(t)} h(s) ds \right] \\ &\leq G\left(c^{\frac{2(p-q)}{p}}\right) + \frac{2(p-q)}{p} \left[ \int_0^{\alpha(t)} f(s) \left( 1 + \int_0^s g(\tau) d\tau \right) ds + \int_0^{\beta(t)} h(s) ds \right]. \end{aligned}$$

Using the relation  $u(t) \leq [z(t)]^{\frac{1}{p}} \leq [m(t)]^{\frac{1}{p-q}}$ , we get the desired inequality (2.16).

If  $c = 0$ , the result can be proved by repeating the above procedure with  $\varepsilon > 0$  instead of  $c$  and subsequently letting  $\varepsilon \rightarrow 0$ . This completes the proof.  $\square$

*Remark 4.* Theorem 2 of Lipovan in [9] is a special case of Theorem 2.5 above, under the assumptions that  $p = 2$ ,  $q = 1$ ,  $g(t) \equiv 0$  and  $\beta(t) \equiv t$ .

### 3. Application

*Example 3.1.* Consider the delay integral equation

$$(3.1) \quad x^5(t) = x_0^2 + 2 \int_0^{\alpha(t)} \left[ x^3(s) M\left(s, x(s), \int_0^s N(s, \tau, w(|x(\tau)|)) d\tau\right) + h(s) x^3(s) \right] ds.$$

Assume that

$$(3.2) \quad |M(s, t, v)| \leq f(s) |v|, \quad |N(s, t, v)| \leq g(t) |v|,$$

where  $f, g, h, \alpha$  and  $w$  are as defined in Theorem 2.1. From (3.1) and (3.2) we obtain

$$|x(t)|^5 \leq x_0^2 + 2 \int_0^{\alpha(t)} \left[ |x(s)|^3 f(s) \int_0^s g(\tau) w(|x(\tau)|) d\tau + h(s) |x(s)|^3 \right] ds.$$

Applying Theorem 2.1 to the last relation, we get an explicit bound on an unknown function

$$(3.3) \quad |x(t)| \leq \left\{ G^{-1} \left[ G(\xi(t)) + \frac{4}{5} \int_0^{\alpha(t)} f(s) \int_0^s g(\tau) d\tau ds \right] \right\}^{\frac{1}{2}},$$

where

$$\xi(t) = \left| \sqrt[5]{x_0^4} \right| + \frac{4}{5} \int_0^{\alpha(t)} h(s) ds.$$

In particular, if  $\omega(t) \equiv t$  holds in (3.1), from (2.4) we derive

$$(3.4) \quad G(t) = \int_0^t \frac{1}{\omega\left(s^{\frac{1}{p-q}}\right)} ds = \int_0^t \frac{1}{s^{\frac{1}{p-q}}} ds = \int_0^t s^{-\frac{1}{2}} ds = 2\sqrt{t}$$

and

$$(3.5) \quad G^{-1}(t) = \frac{1}{4}t^2.$$

Substituting (3.4) and (3.5) into inequality (3.3), we get

$$|x(t)| \leq \sqrt{\xi(t)} + \frac{2}{5} \int_0^{\alpha(t)} f(s) \int_0^s g(\tau) d\tau.$$

*Example 3.2.* Consider the following equation

$$(3.6) \quad x^8(t) = x_0^2 + 2 \int_0^{\alpha(t)} \left[ x^4(s) \left( M(s, x(s), w(|x(s)|)) \right. \right. \\ \left. \left. + \int_0^s N(s, \tau, w(|x(\tau)|)) d\tau \right) \right] ds + 2 \int_0^{\alpha(t)} [h(s)x^4(s)] ds.$$

Assume that

$$(3.7) \quad |M(s, t, v)| \leq f(s) |v|, \quad |N(s, t, v)| \leq f(s)g(t) |v|,$$

where  $f, g, h, \alpha$  and  $w$  are as defined in Theorem 2.4. From (3.6) and (3.7) we obtain

$$|x(t)|^8 \leq x_0^2 + 2 \int_0^{\alpha(t)} \left[ |x(s)|^4 f(s) \left( w(|x(s)|) \right. \right. \\ \left. \left. + \int_0^s g(\tau)w(|x(\tau)|) d\tau \right) + h(s) |x(s)|^4 \right] ds.$$

By Theorem 2.4 we get an explicit bound on an unknown function

$$(3.8) \quad |x(t)| \leq \left\{ G^{-1} \left[ G(\xi(t)) + \int_0^{\alpha(t)} f(s) \left( 1 + \int_0^s g(\tau) d\tau \right) ds \right] \right\}^{\frac{1}{4}},$$

where

$$\xi(t) = |x_0| + \int_0^{\alpha(t)} h(s) ds.$$

In particular, if  $\omega(t) \equiv t^3$  holds in (3.6), from (2.4) we obtain

$$(3.9) \quad G(t) = \int_0^t \frac{1}{\omega\left(s^{\frac{1}{p-q}}\right)} ds = \int_0^t \frac{1}{s^{\frac{3}{p-q}}} ds = \int_0^t s^{-\frac{3}{4}} ds = 4t^{\frac{1}{4}}$$

and

$$(3.10) \quad G^{-1}(t) = \frac{1}{256} t^4.$$

Substituting (3.9) and (3.10) into (3.8) we get

$$|x(t)| \leq [\xi(t)]^{\frac{1}{4}} + \frac{1}{4} \int_0^{\alpha(t)} f(s) \left(1 + \int_0^s g(\tau) d\tau\right) ds.$$
