Abstract: This paper describes a floristic study of Bozburun Mountain and its environs. The study was conducted between 1998 and 2002, during which time 2419 vascular plant samples were collected. After the identification of the specimens, the total flora was determined to consist of 645 taxa belonging to 341 genera and 86 families. The endemism rate of the 645 taxa was 16.1% (n = 104 taxa). The phytogeographical spectrum of the species was as follows: Mediterranean 207 (32.1%), Irano-Turanian 51 (7.9%) and Euro-Siberian elements 33 (5.1%). Of the species we sampled, 311 (48.2%) were widespread and the phytogeographical regions of 10 (1.5%) were unknown.

The order of the 10 families and genera involving most of the taxa were as follows:

Families: Fabaceae: 77 (11.9%); Asteraceae: 71 (11%); Lamiaceae: 41 (6.4%); Caryophyllaceae: 41 (6.4%); Brassicaceae: 36 (5.6%); Apiaceae: 31 (4.8%); Poaceae: 24 (3.7%); Ranunculaceae: 22 (3.4%); Rosaceae: 22 (3.4%); Boraginaceae: 22 (3.4%).

Genera: Silene: 16 (2.5%); Trifolium: 15 (2.3%); Ranunculus: 10 (1.5%); Veronica: 9 (1.4%); Hypericum: 9 (1.4%); Verbascum: 8 (1.2%); Astragalus: 7 (1.1%); Lathyrus: 7 (1.1%); Sedum: 7 (1.1%); Medicago: 7 (1.1%).

Bozburun Dağı ve Çevresinin Florası (Antalya-Isparta-Burdur, Turkey)

Özet: Bu çalışmada Bozburun Dağı ve yakın çevresinin florası araştırılmıştır. Araştırma alanında 1998-2002 yıllarında 2419 bitki örneği toplanmış, çalışmalar sonucunda 86 familyaya ve 341 cinsine ait 645 takson tespit edilmiştir. Alandaki endemizm oranı 104 takson için %16,1'dir. Türlerin fitocoğrafik bölgelere dağılımı ve oranları sırasıyla şöyledir: Akdeniz elementi 207 adet (% 32,1), İran-Turan elementi 51 adet (% 7,9) ve Avrupa-Sibirya elementi 33 adet (% 5,1) şeklindedir. Teşhisi yapılan taksonların 311 adedi (% 48,2) geniş yayılışlı ve 10 adedi ise (% 1,5) hangi fitocoğrafik bölge elementi olduğu bilinmemektedir.

Çalışma alanında en fazla taksona sahip olan familya ve cinsler şöyledir:

Familyalar: Fabaceae 77 (% 11,9), Asteraceae 71 (% 11), Lamiaceae 41 (% 6,4), Caryophyllaceae 41 (% 6,4), Brassicaceae 36 (% 5,6), Apiaceae 31 (% 4,8), Poaceae 24 (% 3,7), Ranunculaceae 22 (% 3,4), Rosaceae 22 (% 3,4) and Boraginaceae 22 (% 3,4).

Cinsler: Silene 16 (% 2,5), Trifolium 15 (% 2,3), Ranunculus 10 (% 1,5), Veronica 9 (% 1,4), Hypericum 9 (% 1,4), Verbascum 8 (% 1,2), Astragalus 7 (% 1,1), Lathyrus 7 (% 1,1), Sedum 7 (% 1,1) and Medicago 7 (% 1,1).

Introduction

The study area included Bozburun Mountain and its environs, which is located in the western part of Turkey's Mediterranean region, within the borders of Antalya, Isparta, and Burdur. The study area, which lies within

square C3 according to the grid square system given by Davis (1965-1988), is located within the Mediterranean phytogeographical zone. Altitude in the study area ranges from 50 to 2505 m.

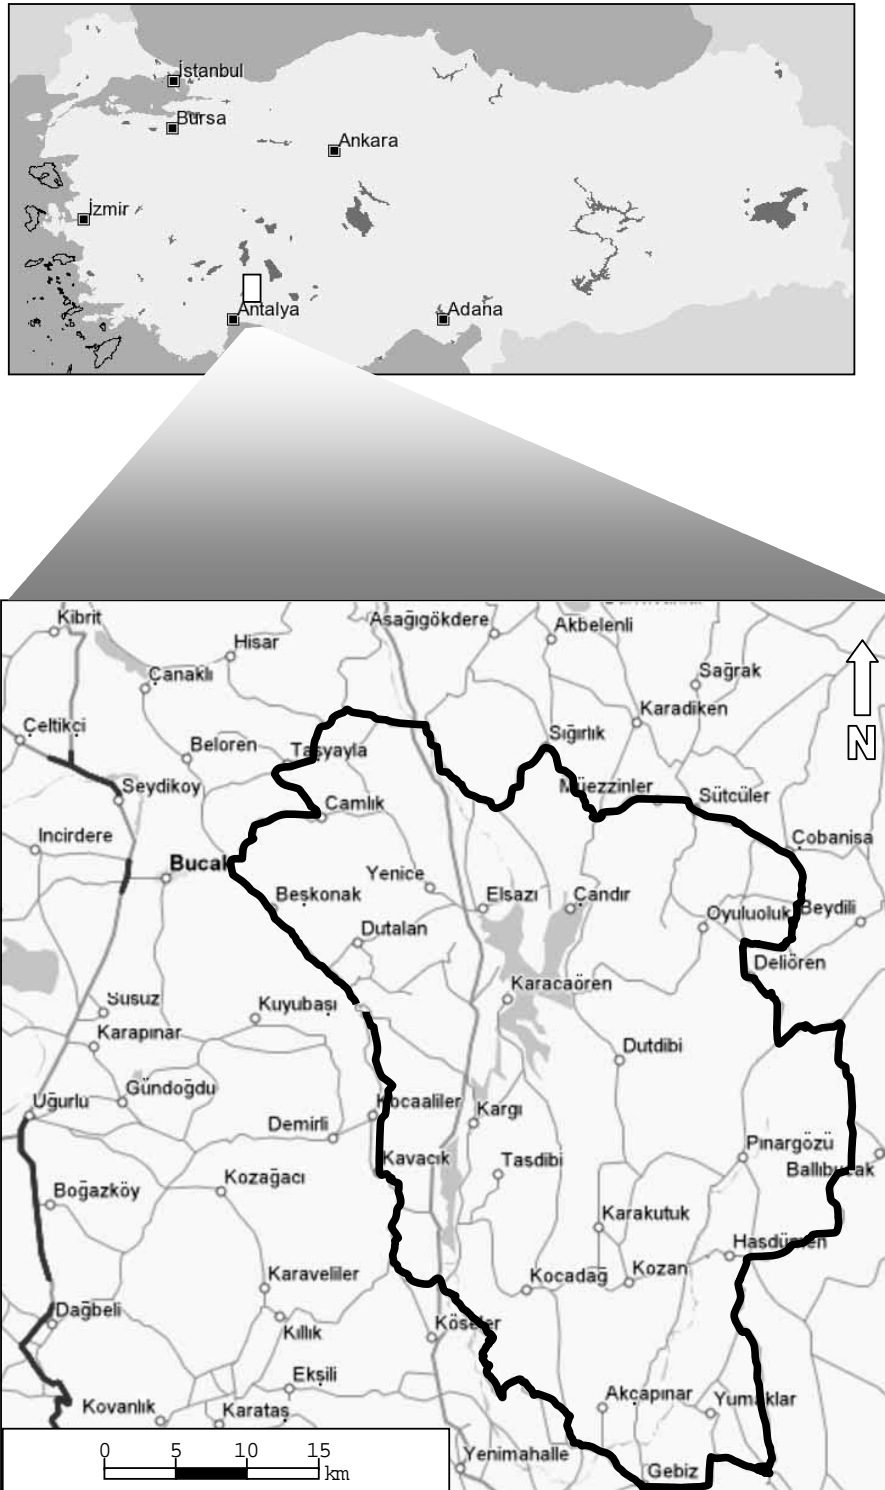

Figure 1. Map of the study area.

Bozburun Mountain and its environs were selected as the research area because they have not been thoroughly studied and have some interesting characteristics, in terms of both flora and phytogeography. Prior to the present study, there had been no detailed study of the flora of this area. The first study of the research area was conducted by Davis and Ayaşlıgil (Ayaşlıgil, 1987).

The aim of the present study was to contribute to the completion of the total flora of the Mediterranean region and Bozburun Mountain.

The climate of the area was reviewed using data from the Meteorology Station in Antalya (DMİGM, 2000). The meteorological data were obtained for the years 1965 to 2000 and the mean annual precipitation in the area was 1052 mm. The most arid and hottest months were July and August, with a mean temperature of 28 °C. The annual mean temperature was 18.48 °C. The typical climate of the Mediterranean predominates, characterised by hot and dry summers, and rainy winters (Akman, 1990).

When the climatic data were used in Emberger's formula of rain and temperature factors, it was determined that the research area had a Mediterranean humid climate. It can be seen that heavy rain occurred in November, December, January, and February, while the dry period extended from the beginning June until the end of October (Akman, 1990).

The geological structure of the study area mostly contains rocks belonging to the Quaternary, Mesozoic, Tersier, and Palaeozoic periods. The most abundant soil types in the area were red-brown Mediterranean soil, red Mediterranean soil, brown forest soil, and colluvial and alluvial soil (Atayeter, 2005).

Maquis, forest, rocky, and hydrophyte were the main vegetation types in the area. Maquis formations were found on the east and west banks of the Aksu stream and Bozburun Mountain. *Quercus coccifera* L., *Olea europaea* L. var. *sylvestris* (Miller) Lehr., *Ceratonia siliqua* L., *Arbutus andrachne* L., *Cotinus coggygria* Scop., *Pistacia terebinthus* L. subsp. *palaestina* (Boiss.) Engler, *Phillyrea latifolia* L., and *Juniperus oxycedrus* L. subsp. *oxycedrus* are the characteristic species of vegetation at altitudes of 160-960 m.

Forest vegetation is distributed between 180 and 1750 m. *Pinus brutia* Ten. var. *brutia* and *Pinus nigra* Arn. subsp. *pallasiana* (Lamb.) Holmboe are the dominant

species in this area. *Cedrus libani* A.Rich., *Juniperus excelsa* M.Bieb. subsp. *excelsa* and *Liquidambar orientalis* Miller are subdominant species widely distributed in the area.

Bozburun Mountain and its environs are covered by rocky vegetation, which have upper and lower limits of 560 and 2050 m. *Euphorbia kotschyna* Fenzl, *Astragalus paecilanthus* Boiss. & Heldr., *Marrubium globosum* Montbret & Aucher ex Bentham subsp. *globosum*, *Rosa pulverulanta* Bieb., *Veronica cuneifolia* D.Don. subsp. *cuneifolia*, *Dianthus zonatus* Fenzl var. *hypoclorus* (Boiss. & Heldr.) Reeve, *Verbascum glomeratum* Boiss., *Origanum minutiflorum* O.Schwarz & P.H.Davis, *Teucrium chamaedrys* L. subsp. *chamaedrys* and *Phlomis armeniaca* Willd. are the characteristic species of this type of vegetation and it includes a large number of local endemic species.

Hydrophytic vegetation is found in streamside and lakeside formations. These formations are distributed on the sandy, gravely alluvial flat of the Aksu stream, as well as permanently wet and torrent or dry riverbeds. *Platanus orientalis* L., *Alnus orientalis* Decne. var. *orientalis*, *Liquidambar orientalis* Miller, *Erica manipuliflora* Salisb., *Vitex agnus-castus* L., *Nerium oleander* L., *Equisetum ramosissimum* Desf., *Carex muricata* L., *Juncus articulatus* L. and *Cynodon dactylon* (L.) Pers. var. *dactylon* are commonly found in these formations.

The "yayla peasantry" is still the dominant style of rural life within the study area. The combination of agriculture, animal grazing, and forestry that is practised here can be regarded as a land-use system that is ecologically well adapted to the existing natural conditions (Ayaşlıgil, 1987).

Materials and Methods

In total, 2419 vascular plant taxa were collected and observed or photographed in the study area during fieldwork conducted between 1999 and 2002. The collected plant taxa were dried according to herbarium techniques, and numbered and recorded. The Flora of Turkey (Davis, 1965-1985; Davis et al., 1988; Güner et al., 2000) and other floras and references (Tutin et al., 1964-1980; Yaltırık, 1984) were used for the identification of the specimens. Some specimens were determined by Ayaşlıgil (Istanbul Univ., İstanbul) and

The proportion of species from more than one region or of unknown phytogeographical origin was 49.7%. This high percentage was due to the presence of a high number of cultivated plants, and for many of these species, inadequate information is available concerning their distribution.

The phytogenic distribution data from the present study were compared to 9 other floristic studies and are presented in Table 3 (Peşmen, 1982; Dural et al., 1995; Kargioğlu & Ertuğrul, 1995; Özçelik & Öztürk, 1999; Düşen & Sümbül, 2001; Özçelik & Korkmaz, 2002; Deniz & Sümbül, 2004). This table includes the number of taxa and phytogeographical distribution of species. In all of the studies performed in the Mediterranean phytogeographical region, the number of Mediterranean elements is naturally higher than that of elements belonging to other regions. In the study conducted on Yandağ, Aksu, and Yıldız mountains, the presence of Mediterranean elements was low because the studied areas were far from the Mediterranean sea. When the numbers of Irano-Turanian elements found in these 9 studies were compared, the results of the studies on Sütçüler, Yandağ, and Davras mountains were similar to those of the present study. In the studies conducted on Yıldız Mountain, the number of reported Irano-Turanian elements was higher than those in the other 8 studies

since these areas are not as geographically close to the Irano-Turanian phytogeographical region as Yıldız Mountain is. When the number of Euro-Siberian elements found in these studies were compared, Olimpos-Beydağları constituted less than 1% due to the scarcity of marshy habitats in the area.

The level of multiregional species and those of unknown phytogeographical origin are higher in all the studies. Since Turkey serves as a bridge between south-west Asia and south-east Europe, and little information about the distribution of some species is available, the percentages of multiregional species and those of known phytogeographical origin in Turkey are generally high (Deniz & Sümbül, 2004).

When the number of taxa is taken into consideration, the family *Fabaceae* ranks first with 77 taxa (Table 3); this is because *Fabaceae* is the second largest family of the Turkish Flora and includes a large number of genera containing many taxa. Following *Fabaceae*, the family *Asteraceae* is the second largest family of the Turkish Flora, having many family members, the greatest ecological tolerance, and seeds that break up easily. *Fabaceae* and *Asteraceae* are the two most abundant families of the Turkish Flora in most floristic studies, which is due to the diversity of vegetation types, soil composition, climatic conditions, and topography.

Following *Asteraceae* are: *Lamiaceae*, which is represented by 41 taxa; *Caryophyllaceae* with 41 taxa; *Brassicaceae* with 36 taxa; and *Apiaceae* with 31. The 10 largest families according to the number of taxa are shown in Table 4.

Table 4. Taxa totals of the largest families.

Families	Genera	Taxa	Taxa %
<i>Fabaceae</i>	26	77	11.9
<i>Asteraceae</i>	40	71	11
<i>Lamiaceae</i>	22	41	6.4
<i>Caryophyllaceae</i>	24	41	6.4

<i>Rosaceae</i>	11	22	3.4
<i>Boraginaceae</i>	11	22	3.4
Other Families	135	236	36.6

The taxa belonging to the first 10 families form about 63% of the total taxa.

The genera with the largest number of taxa in the study area are shown in Table 5. In the present study, the genus *Silene* had the highest number of taxa. As the estimated number of taxa belonging to *Astragalus* in Turkey is 400, one would expect to find a higher number of taxa. This might be the result of the unsuitable ecological factors and habitat for taxa in the genus *Astragalus* within the study area. Most taxa in *Astragalus* are known as steppic plants of Irano-Turanian phytogeographical regions.

The number of endemic taxa in the study area was 104 and the endemism rate was 16.1%. Of these taxa, 53 belong to the Mediterranean, while 22 taxa belong to the Irano-Turanian and 1 belongs to the Euro-Siberian phytogeographical regions. The number of multiregional endemic plants was 28. The proportion of endemism in the area (16.1%) was below the average for Turkey (33.5%) (Ekim, 1990), which might have been due to the edaphic, climatic, and topographic properties of the region.
