Abstract: This paper describes a floristic study of Kızıldağ (Isparta/Turkey) and its environs. The study was carried out during 1993-1996 and 1515 vascular plant samples were collected. After the identification of the specimens, the total flora has been determined as 786 taxa belonging to 770 species, 371 genera and 84 families. The endemism rate of the area is 15.5% for the 122 taxa. The largest 3 families are *Asteraceae* (89 species), *Fabaceae* (65 species) and *Poaceae* (62 species). The largest genera are *Ranunculus* L. (13 species), *Allium* L. (13 species) and *Veronica* L. (12 species). The phytogeographical spectrum of the species is as follows: Irano-Turanian elements 143 (18.19%), Mediterranean elements 140 (17.81%) and Euro-Siberian elements 40 (5.08%). One hundred and seventy-three species are new records from B3 and C3 squares. Similarities between the taxa of Kızıldağ and those of 11 other studies performed near our study area were compared using clustering analysis.

Kızıldağ (Isparta) ve Çevresinin Florası

Özet: Bu çalışmada, Kızıldağ (Isparta) ve yakın çevresinin florası araştırılmıştır. Araştırma alanında 1993-1996 yıllarında 1515 bitki örneği toplanmış, çalışmalar sonucunda 84 familya, 371 cins ve 770 türe ait 786 takson saptanmıştır. Alandaki endemizm oranı 122 taxon için % 15.5' dir. En büyük 3 familya *Asteraceae* (89 tür), *Fabaceae* (65 tür) ve *Poaceae* (62 tür)'dir. En büyük cinsler *Ranunculus* (13 tür), *Allium* (13 tür) ve *Veronica* (12 tür) dir. Türlerin fitocoğrafik bölgelere dağılımı ve oranları sırasıyla şöyledir: İran-Turan elementleri 143 (% 18.19); Akdeniz elementleri 140 (% 17.81) ve Avrupa-Sibirya elementleri 40 (% 5.08). 173 tür B3 ve C3 karelerine ait yeni kare kayıtları olarak bulunmuştur. Kızıldağ ve yakınında bulunan diğer 11 çalışma arasındaki takson benzerlikleri küme analizi ile kıyaslanmıştır.

Introduction

Kızıldağ Mountain is located in the eastern part of Isparta province in the northern part of the Kızıldağ National Park, which is situated in the Irano-Turanian phytogeographic region. The main part of the study area is located in B3 and the rest in C3 according to the grid system adopted in the Flora of Turkey (Davis, 1965-1985). The northern and eastern borders of the area are the Isparta roads, the south-western border is the Kurucuova road, and southern border is Lake Beyşehir (Figure 1). The Kızıldağ area is dominated by small mountain ranges lying in a SW-NE direction. The altitude of the area is between 1100 m at Lake Beyşehir and 1900 m at the summit of Kızıldağ Mountain. There have been no other specific studies related to the flora of the area. Most part of the area is isolated from its environs and situated in the national park.

Limestone rocks constitute the main type in the area. In addition to this, alluvium is present. Mesozoic series are the oldest rocks around the village of Belceğiz and Homat Hill. The youngest geological unit of the area belongs to the Quaternary period. The alluvial layer extends to the lakesides and streambeds, whose depths reach 10 m in some locations (Atalay, 1982).

The climate of the area was examined using data from the Meteorology Station in Şarkikaraağaç (DMİGM, 1984). The meteorological data were obtained from 1965 to 1984. The main annual precipitation in the area is 453.4 mm, and the precipitation type is W.Sp.A.S. The most arid and hottest months are June and July, with a mean temperature of 28.4 °C. The mean temperature for the year is 11.2 °C. When the climatic data was used in Emberger's formula of rain and temperature factors (Q:

Figure 1. Geographic map of the study area.

49.46), it was determined that the research area has a Mediterranean semi-dry climate (Akman, 1990).

Shrub, forest, rocky, steppe, and hydrophyte are the main vegetation types in the area. Shrub formation is found from Zeybek Hill to the village of Karayaka. *Quercus coccifera* L. is the dominant species in this vegetation at altitudes of 1100-1200 m. *Juniperus oxycedrus* L. subsp. *oxycedrus*, *Pistacia terebinthus* L. subsp. *palaestina* (Boiss.) Engl., *Crataegus monogyna*

Jacq. subsp. *monogyna*, *Daphne oleoides* Schreb. subsp. *oleoides* and *Cistus laurifolius* L. are the other characteristic species of the formation.

Forest vegetation is distributed commonly between 1150 and 1850 m. *Cedrus libani* A.Rich. is dominant only on the northern side of Kızıldağ in this area. *Juniperus excelsa* M.Bieb. is a subdominant species widely distributed in the area, but especially between the Zeybek and Külbasi hills.

Hydrophytic vegetation is found in the streamside and lakeside formations. For instance, *Populus alba* L. members are found at the streamside as a dominant vegetation type at 1100-1150 m. This formation is distributed between Yassibel and İncebel. *Salix alba* L., *Rosa canina* L., *Rubus sanctus* Schreb., *Galium verum* L. subsp. *glabrescens* Ehrend., *Geranium sylvaticum* L., *Ranunculus ficaria* L. subsp. *ficariiformis* Rouy & Foucaud, *Lythrum hyssopifolia* L., *Carex distans* L., *Cyperus longus* L. and *Veronica anagallis-aquatica* L. are commonly found in this formation. The lakeside formation is distributed on the northern side of Lake Beyşehir especially at 1100 m. *Phragmites australis* (Cav.) Trin. ex Steud., *Scirpioides holoschoenus* (L.) Sojak, *Barbarea intermedia* Bor, *Rumex crispus* L., *Potentilla supina* L., *Carex muricata* L. and *Epilobium minutiflorum* Hausskn. dominate in this formation.

The southern parts of Kızıldağ Mountain are covered by rocky vegetation. The upper and lower limits of this vegetation are 1100 to 1900 m. *Arenaria leptoclados* (Rchb.) Guss., *Dianthus elegans* d'Urv. var. *elegans*, *Campanula stricta* L. var. *stricta*, *Rosularia chrysantha* (Boiss.) Takht., *Sedum amplexicaule* DC., *Sedum album* L., *Saxifraga tridactylites* L. and *Umbilicus erectus* DC. are the characteristic species of this vegetation type.

The altitude of the research area ranges from 1100 to 1400 m. The area is covered by steppes, which can be divided into 2 groups: grass steppes and tragacanthic steppes. Grass steppes are found at 1100 m on the southern side of the research area. *Ranunculus repens* L., *Lamium amplexicaule* L., *Crepis foetida* L. subsp. *rheodifolia* (M.Bieb.) Čelak. and *Crepis setosa* Hallier f. are distributed in rather damp areas in this vegetation type. *Aegilops cylindrica* Host, *Aegilops triuncialis* L. subsp. *triuncialis*, *Bromus* L. spp., *Cynodon dactylon* (L.) Pers. var. *villosus* Regel, *Taeniatherum caput-medusae* (L.) Nevski subsp. *asper* (Simonk.) Melderis, *Poa bulbosa* L. and *Festuca heterophylla* Lam. are also found in semi-dry habitats in this formation. The northern side of the study area is mainly covered by tragacanthic steppes, which are composed of *Astragalus plumosus* Willd. subsp. *krugianus* (Frey & Bornm.) Chamb. & Matthews, *A. tmoleus* Boiss. var. *bouanacanthus* (Boiss.) Chamberlain, *A. angustifolius* Lam. subsp. *angustifolius* var. *angustifolius*, *Acantholimon acerosum* (Willd.) Boiss. var. *acerosum* and *A. caesareum* Boiss. & Bal.

Materials and Methods

The materials of this study are 1515 vascular plant specimens collected from Kızıldağ Mountain and its environs between 1993 and 1996. These specimens were identified basically by using the Flora of Turkey (Davis, 1965-1985; Davis et al., 1988; Güner et al., 2000), other floras (Boissier, 1867-1888; Rechinger et al., 1965-1977; Tutin & Heywood, 1964-1980; Zohary, 1966-1986; Komarov & Shishkin, 1933-1964; Townsend & Evan, 1966-1985; Bor, 1968; Meikle, 1977-1985; Pignatti, 1982) and revisions (Leblebici, 1990; Doğan, 1999; Aytaç, 1997; Dönmez & Yıldırım, 2000). In the floristic list, whether the plant is endemic or not, and which phytogeographical region and threatened categories it belongs to are mentioned at the end. Cultivated plants are also indicated in parentheses at the end of the locality. Since all the plants were collected from the study area in Şarkikaraağaç, Isparta, this information is not repeated. Author's abbreviations follow Brummitt and Powell (1992). Threatened categories are proposed for endemic and some non-endemic taxa according to IUCN risk categories (IUCN, 2001; Ekim et al., 2000). The phytogeographical regions of the taxa were evaluated according to Davis (1965-85, 1988) and other related studies (Sümbül & Erik, 1988; Duman, 1991), but mainly Davis' records are taken into consideration. The results were compared with floras of neighbouring areas (Küçüködük, 1989; Kargioğlu & Ertuğrul, 1995; Dural et al., 1995; Sorger, 1978; Serin & Çetik, 1982; Küçüködük & Çetik, 1984; Ocakverdi, 1982; Peşmen & Güner, *pers. com.*; Savran et al., 1995; Özçelik & Öztürk, 1999; Fakir & Dutkuner, 1999). The abbreviations used in the text and the floristic list are as follows: Ir.-Tur.: Irano-Turanian; Medit.: Mediterranean; E. Medit.: East Mediterranean; E. Medit. (mt.): East Mediterranean (mountain); Euro-Sib.: Euro-Siberian; En.: Endemic; CR: Critically endangered; EN: Endangered; VU: Vulnerable; NT: Near threatened; LC: Least concern; Mutlu: Birol Mutlu; HUB: Hacettepe University Department of Botany Herbarium in Ankara. At least one sample for each taxon is deposited at HUB.

Similarities between the taxa from Kızıldağ and those from 11 other studies were compared using clustering analysis. The NTSYS program written for the IBM PC by Rohlf (2000) for clustering and ordination analysis was used. The SIMQUAL similarity and COMPLETE clustering are used because of their practical value within the

context of the philosophy of numerical taxonomy (Sneath & Sokal, 1973).

Discussion

At the end of this study, 1515 vascular plant specimens were collected from the area, and 770 species (786 taxa) and 371 genera belonging to 84 families were established. Seven species are non-flowering vascular plants. Seven species belong to *Gymnospermae*, while the other 756 were *Angiospermae*. *Dicotyledones* and *Monocotyledones* consist of 636 and 120 species respectively. A summary of the numerical data is presented in Table 1.

In the area, 122 taxa are endemic to Turkey and the ratio of endemism is 15.5%. Most of the endemic taxa in the area grow on Kızıldağ Mountain. Therefore, Kızıldağ Mountain appears to be important for the conservation of these endemic taxa.

A total of 125 taxa, all endemics, and 3 non-endemics were evaluated according to IUCN risk categories (IUCN, 2001; Ekim et al., 2000). The results are summarised in Table 1. The distribution of the threat categories of these taxa are as follows: 2 taxa CR, 5 taxa EN, 10 taxa VU, 14 taxa NT and 94 taxa LC. The species in the CR and EN risk categories are given in Table 2.

A comparison of some basic numbers from the other 11 floristic studies taken into consideration with those from Kızıldağ is given in Table 3. This table includes the numbers of total taxa, taxa not existing in other areas, endemic taxa and endemic taxa not existing in other areas. As seen in Table 3, Kızıldağ ranks second, third, fourth and third for the properties above, respectively. Kızıldağ, Dedegöl, West of Lake Beyşehir and Aksu are the most important areas according to these properties compared with the other areas.

the area are *Asteraceae* (89 spp.), *Fabaceae* (65 spp.), *Poaceae* (62 spp.), *Brassicaceae* (51 spp.) and *Lamiaceae* (41 spp.) respectively (Table 4.). In comparison with the Flora of Turkey (Davis et al., 1988), the order of the families is approximately the same in this study. Yandağ is more similar to Kızıldağ in this respect than the others. The reason for this is surely the closeness of this area to Kızıldağ Mountain.

The largest genera in terms of species number in the area are *Ranunculus* L. (13 spp.), *Allium* L. (13 spp.), *Veronica* L. (12 spp.), *Astragalus* L. (11 spp.) and *Silene* L. (11 spp.), respectively. These genera are also relatively widespread throughout Turkey. The largest genera are compared with those of nearby areas (Table 5). As seen in Table 5, *Astragalus* exists in all areas except for Lake Akşehir. This genus is also relatively widespread in Turkey. *Ranunculus* is the largest genus in Kızıldağ and

Lake Akşehir. *Ranunculus* is especially spread in humid and wet places, which are very abundant in these regions.

The distributions of taxa with respect to phytogeographical regions are as follows: Ir.-Tur. elements 143 species (18.19%), Medit. elements 140 species (17.90%) and Euro.-Sib. elements 40 species (5.08%). The rest of the taxa are either multi-regional or phytogeographically unknown (Table 1). The dominance of the Ir.-Tur. elements is expected because the study area is in the Ir.-Tur. region. Ir.-Tur. elements are mostly *Dicotyledones*, while Medit. elements are mostly *Monocotyledones*. The number of Medit. and Ir.-Tur. elements being very close to each other can be explained by the location of the area in the transition zone of both phytogeographical regions. Therefore, Medit. elements gradually increase. Euro.-Sib. elements are the least common in the area because it is very far from the Euro.-Sib. region.

The ratios of phytogeographical elements were compared with those of other studies carried out in the same region (Table 3). The ratio of Ir.-Tur. elements in our study is higher than those of other areas. This result is explained by the fact that only Kızıldağ lies in the Ir.-Tur. region. Owing to Lake Akşehir being wholly an aquatic habitat different from others and in accordance with its climatic conditions, the Euro.-Sib. elements are dominant (a very humid microclimate).

Some morphological characters different from those given in the Flora of Turkey (Davis, 1965-1988) were observed in some specimens. Although *Viola sandracea* has been recorded with "stipules eglandular fimbriate" in the description in the Flora of Turkey (Coode & Cullen, 1965), we determined that glandular fimbriate stipules are present in the samples from the study area. The glandular specimens were collected from Kızıldağ during other research and revision studies of *Viola* and it was published as a new species (*V. kizildaghensis*) with some other differences (Dinç & Yıldırım, 2002). Currently, the new species is only found in this study area and it occupies less than 10 km². Therefore, it should be assessed in the "critically endangered" (CR) category (criteria B1 and B1a). We also observed that *Erodium amanum* specimens collected from the study area have long sepals (11 mm) and tuberous roots. These structures are not mentioned in the description of this species in the Flora of Turkey (Davis, 1967). The seed number in fruits of *Lathyrus saxatilis* was recorded as 3-6 in the description in the Flora of Turkey but in our study the seed number was 7 (Davis, 1970).

A COMPLETE-derived clustering of similarity matrix for the 12 studies is presented in Figure 2. Yandağ-Kızıldağ (0.69), W. Lake Beyşehir-Dedegöl (0.65), Yeşildağ-Sultan-Dökük (0.76) and Lake Beyşehir-Lake-Isparta Gölcük (0.78) are more similar than the other study areas. Yıldız is between the Lake Beyşehir-Lake Akşehir-Isparta Gölcük and the Yeşildağ-Sultan-Dökük studies. In the same way, Aksu is between the Yeşildağ-Sultan-Dökük and W. Lake Beyşehir-Dedegöl studies. These results were closely related with closeness, altitude and similarities of habitat.

Two species, *Fritillaria carica* Rix subsp. *serpanticola* Rix and *Cirsium dirmilense* R.M.Burton (Burton, 1996), are known only from the type localities and were collected for the second time from the study area.

One hundred and fifty-eight species out of 786 taxa are new records for the square B3 and 15 are new for C3 (Donner, 1990). These new records have been published previously (Mutlu & Erik, 1996, 1999).
