**Abstract:** *Heliotropifolium ovalifolium* Forssk. (*Boraginaceae*) is reported for the first time for the ora of Turkey, from C5 Adana. Its affinities, ecology and conservation status in Turkey are detailed.

**Key Words:** *Heliotropium*, *Boraginaceae*, new record, Turkey.

### Güney Türkiye'den Yeni Bir Kayıt (*Heliotropium ovalifolium* Forssk.)

**Özet:** *Heliotropifolium ovalifolium* Forssk. (*Boraginaceae*) türü Güney Türkiye'den (C5 Adana) ilk defa kaydedilmektedir. Bu türün betimi, akraba türler ile ilişkisi, ekolojisi ve Türkiye'de'ki tehlike kategorisi ayrıntılı olarak verildi.

**Anahtar Sözcükler:** *Heliotropium*, *Boraginaceae*, yeni kayıt, Türkiye.

### Introduction

We discuss here some unusual specimen of *Heliotropium* L. from S. Turkey. The specimen in question was collected on an expedition to Adana (Karataş-Yumurtalık) province in 1997. After a thorough study of these specimens, we could not determine them using the *Flora of Turkey* (1) or by comparing them with material in ANK, GAZI and HUB herbaria, since *Heliotropium* is a large and complex genus with c. 270-300 species occurring in temperate and tropical regions of both hemispheres (2,3). Therefore we sent our materials to Dr. H. Förther (Münich), a specialist on the genus *Heliotropium*. He determined them as *Heliotropium ovalifolium* Forssk. This species is not known from Turkey so far and is a new record for the flora of Turkey.

Since Riedl's revision of *Heliotropium* was published in Flora of Turkey (1), no species have been added. As a result of this new record of *Heliotropium ovalifolium*, the number of species of *Heliotropium* in Turkey is increased to 15. Of these, 14 are native and one (*H. curassavicum* L.) is a cultivated species.

*Heliotropium ovalifolium* Forssk., Fl. Aegypt.-Arab. 38 (1775). Figure 1.

Annual, up to 5–15 cm tall, much branched, densely clothed with soft whitish adpressed hairs. Leaves petiolate, petiole 1–5 mm long. Lamina 7–15 x 2–4 mm, elliptic to obovate or oblong, acute to mucronate, adpressed hairy on both surfaces (some hairs with tubercles). Inflorescence a terminal cyme, slender, 2–4 cm long, sometimes forked, ebracteate, flowers sessile or subsessile. Calyx c. 1.5–2 mm long, divided to base, 5-partite into unequal lobes, one lobe ovate-lanceolate, much broader than the four other linear lobes, white setose hairy outside, persistent. Corolla white, c. 3 mm long, lobes 1/3 as long as tube; tube cylindrical, outside hairy; lobes ovate, apiculate. Stamens inserted just above base of corolla; anthers small, lanceolate, 0.5–0.6 mm long. Ovary glabrous. Style inconspicuous. Stigma c. 0.4 mm long, conical, apex minutely setose. Fruit ovoid; nutlets 4, c. 1.5 mm long, adpressed hairy. Fl. and Fr. 8–9. *Moist sandy place, nr.s.l.*

Type: Yemen, Hadie [Al Hadiyah], 3. 1763, *Forsskal* 299 (holo. C-Forssk, iso. BM).

Examined specimen: C5 Adana: Karataş, Yumurtalık Lagünü Tabiatı Koruma Alanı, Torluk, moist sandy place, nr s.l., 9 ix 1997, H. Şağıban 1938 with H. Duman (GAZI, HUB).

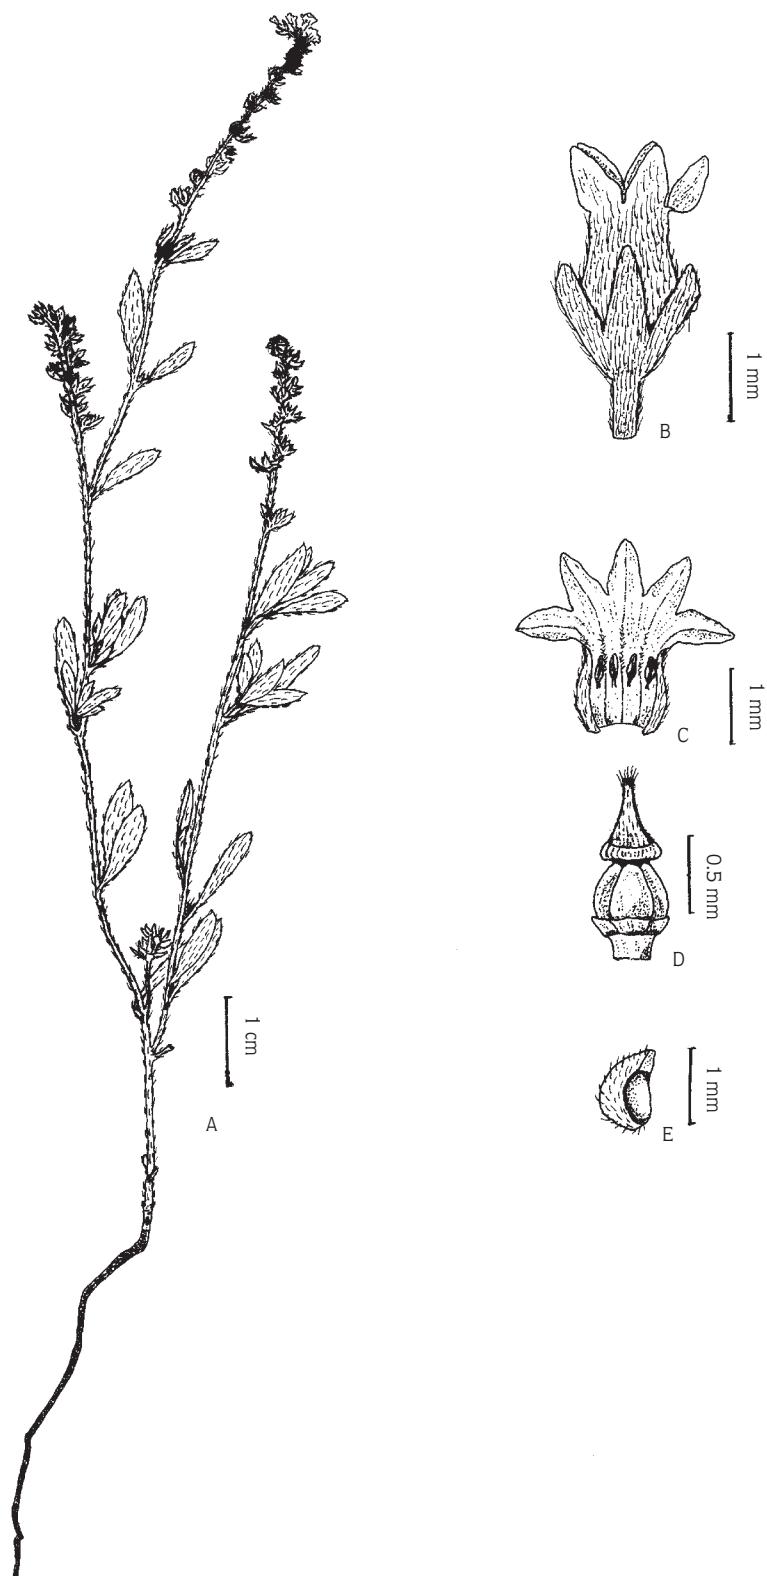

Figure 1. *Heliotropium ovalifolium*. A-habit, B-flower, C-dissected corolla, D-ovary, E-nutlet.

Distribution: Africa, Arabia, Canary Islands, Pakistan, India, Indo-China, Australia.

*Heliotropium ovalifolium* is similar to *H. lasiocarpum* Fisch. & Mey. according to the Flora of Turkey and East Aegean Islands (1). It differs in its smaller stems (5–15 cm, not 50 cm or more), smaller leaves (7–15 x 2–4 mm, not 15–40 x 10–40 mm); shorter calyx (c. 1.5–2 mm long versus 2.5–3 mm); lanceolate and shorter anthers (0.5–0.6 mm long, not c. 1 mm); conical stigma with minutely setose apex (not glabrous and squat-conical); inconspicuous style.

Recommended IUCN Threat Category (4) is Critically Endangered (CR) within Turkey, because the estimated area of occupancy is less than 10 km<sup>2</sup>, and the population is very pure. We collected only 20 specimens in one location. For this reason, we consider that the species in Turkey is in extreme danger.

## Ecology

*Heliotropium ovalifolium* Forssk. occurs on moist sandy places in the South of Adana province (Karataş-Yumurtalık) and also grows with the following species:
