Received 04.06.2001

From the aerial parts of *Phlomis grandiflora* var. *fimbrilligera*, two iridoid glucosides, 8-epi-loganin (1) and auroside (2), together with five phenylethanoid glycosides, forsythoside B (3), alyssonoside (4), verbascoside (5), hattushoside (6) and phlomisethanoside (7), were isolated. Iridoid glucosides auroside (2) and lamiide (8) and phenylethanoid glycosides, forsythoside B (3), alyssonoside (4), and verbascoside (5) as well as a lignan glucoside, syringaresinol-4'-O- $\beta$ -D-glucoside (9), were characterized from the overground parts of *P. fruticosa*. The structures of the isolates were elucidated by means of one and two dimensional (COSY, HSQC and HMBC) NMR techniques and ESI MS.

**Key Words:** Phlomis grandiflora, Phlomis fruticosa, Lamiaceae, iridoid glucosides, phenylethanoid glycosides, lignan glucoside.

# Introduction

The genus Phlomis L. is represented by thirty-four species in the flora of Turkey<sup>1</sup>. Among them, P. grandiflora is characterized by two varieties: P. grandiflora var. grandiflora and P. grandiflora var. fimbrilligera. P. grandiflora var. fimbrilligera is an endemic variety whereas P. fruticosa is a Mediterranean element<sup>1</sup>. To date, different classes of glycosides comprising the phenylpropanoids and phenylethanoids<sup>2-13</sup>, iridoids<sup>3-15</sup>, monoterpenoids<sup>4,11</sup> and diterpenoids<sup>16</sup> as well as a caffeic acid ester<sup>10,12</sup> have been isolated from Turkish Phlomis species. As a part of our continuing chemosystematic studies on the glycosidic constituents of the genus Phlomis, we investigated the aerial parts of Phlomis grandiflora var. fimbrilligera and P. fruticosa. In a previous report, the isolation of two iridoid glucosides, phlomoside A and 8-epi-loganin, together with phenylethanoid glycosides, verbascoside, hattushoside and phlomisethanoside, along with benzyl alcohol  $\beta$ -D-glucoside were described from P. grandiflora var. grandiflora<sup>9</sup>. Investigations on the European sister of P. fruticosa led to the identification of iridoid glucosides, phlomiol and lamiide from the leaves<sup>17</sup> and lamiidoside from the seeds<sup>18</sup>. However, no work has yet been reported on the phenylpropanoid constituents

of P. fruticosa. This paper deals with the study of the iridoid and the phenylpropanoid glycosides in P. grandiflora var. fimbrilligera and P. fruticosa.

# Experimental

General Experimental Procedures: Optical rotations were measured on an Atropol IV polarimeter. UV (MeOH) spectra were recorded on a Shimadzu UV-160A spectrophotometer. IR (KBr) spectra were determined on a Perkin-Elmer FTIR 1720X spectrometer. NMR spectra were recorded on Bruker AMX 300 and Varian Unity 500 spectrometers. ESIMS were recorded on a Finnigan TSQ 7000 mass spectrometer. Polyamide (ICN), silica gel 60H (230-400 mesh), silica gel 60 (0.063-0.200 mm) (Merck) and Sephadex LH-20 were used for CC. Pre-coated silica gel 60 F<sub>254</sub> aluminum sheets (Merck) were used for TLC. Plates were examined by UV fluorescence and sprayed with 1% vanillin in conc. H<sub>2</sub>SO<sub>4</sub>, followed by heating at 105°C for 1-2 min.

Plant Materials. Phlomis grandiflora H. S. Thompson var. fimbrilligera (Hub.-Mor.) Hub.-Mor. was collected from Antalya, Beldibi (S.W. Anatolia, Turkey), 10 km from Beldibi, in April 1997. P. fruticosa L. was collected from İzmir, Çeşme (W. Anatolia, Turkey), in the vicinity of Çiftlik village, in April 2000. Voucher specimens have been deposited in the Herbarium of the Pharmacognosy Department, Faculty of Pharmacy, Hacettepe University, Ankara, Turkey (HUEF 97-045 and 00-028, resp.).

Extraction and Isolation. P. grandiflora var. fimbrilligera - Air-dried aerial parts of the plant (420 g) were extracted twice with MeOH-H<sub>2</sub>O (4:1, each 4.5 l) at 60°C. After evaporation of the combined extract, H<sub>2</sub>O (500 ml) was added and the insoluble material was removed by filtration. The filtrate was then extracted with a CHCl<sub>3</sub> and the water phase was concentrated to dryness and lyophilized (56 g, yield 13.3%). An aliquot of the aqueous extract (11.6 g) was fractionated over polyamide (200 g) employing H<sub>2</sub>O (500 ml) and gradient MeOH-H<sub>2</sub>O mixtures (25-100%, each 300 ml) to yield 7 main fractions (A-G). Fr. A was first extracted with n-BuOH (3x150 ml) to obtain a crude n-BuOH fraction (1610 mg). An aliquot of this fraction (880 mg) was subjected to silica gel CC (80 g), eluting with a CH<sub>2</sub>Cl<sub>2</sub>-MeOH-H<sub>2</sub>O mixture (80:20:1, 80:20:2 and 70:30:3, each 500 ml) to yield 1 (110 mg) and 2 (357 mg). Fraction C (214 mg) was chromatographed over silica gel (35 g) using a CH<sub>2</sub>Cl<sub>2</sub>-MeOH-H<sub>2</sub>O mixture (80:20:1, 500 ml) as eluent to afford 3 (28 mg), 4 (12 mg), 6 (46 mg) and 7 (20 mg). Compounds 4, 6 and 7 were purified on Sephadex with MeOH. Fraction E (140 mg) was subjected to silica gel (20 g) CC employing a CH<sub>2</sub>Cl<sub>2</sub>-MeOH-H<sub>2</sub>O mixture (80:20:1, 500 ml) to yield 5 (75 mg).

P. fruticosa - Dried and milled overground parts of P. fruticosa (512 g) were extracted twice with MeOH (each 2.5 l) at 60°C to give a crude MeOH extract (66.7 g, yield 13.2%). The MeOH extract was concentrated to dryness and the residue was taken up in H<sub>2</sub>O. The water-soluble portion was partitioned between CHCl<sub>3</sub> (3x150 ml) and n-BuOH (4x150 ml), sequentially. The n-BuOH extract (34.7 g, yield 6.8%) was fractionated by polyamide CC (200 g) with H<sub>2</sub>O (500 ml) and MeOH-H<sub>2</sub>O mixtures (25-100%, 300 ml each). This yielded 8 main fractions (A-H). Fr. A (5.53 g) was subjected to silica gel CC (200 g) and eluted with a CH<sub>2</sub>Cl<sub>2</sub>-MeOH-H<sub>2</sub>O mixture (90:10:1, 80:20:2, 70:30:3 and 60:40:4, each 500 ml) to yield frs. A<sub>1</sub>-A<sub>6</sub>. Fraction A<sub>4</sub> (305 mg), which was then subjected to silica gel CC (30 g) with CH<sub>2</sub>Cl<sub>2</sub>-MeOH-H<sub>2</sub>O (80:20:2, 250 ml) as eluent, gave 2 (14.8 mg) and 8 (26 mg). Fraction D (814.5 mg) was chromatographed over silica gel (80 g) using a CH<sub>2</sub>Cl<sub>2</sub>-MeOH-H<sub>2</sub>O mixture (80:20:2 and 70:30:3, each 500 ml) to afford 3

and 4, which were then purified by Sephadex CC with MeOH to give pure 3 (11.3 mg) and 4 (7.75 mg). Fraction G (715.7 mg) was subjected to silica gel (65 g) CC, employing CH<sub>2</sub>Cl<sub>2</sub>-MeOH (80:20, 250 ml) and CH<sub>2</sub>Cl<sub>2</sub>-MeOH-H<sub>2</sub>O (80:20:2, 250 ml) mixtures to yield 5 (230.5 mg).

8-epi-loganin (1):  $C_{17}H_{26}O_{10}$ ;  $UV \lambda_{max}$  (MeOH) nm: 236;  $IR v_{max}$  (KBr) cm<sup>-1</sup>: 3400, 1690, 1635 cm<sup>-1</sup>; <sup>1</sup>H NMR (CD<sub>3</sub>OD, 500 MHz):  $\delta$  7.39 (1H, s, H-3), 5.51 (1H, d, J= 4.0 Hz, H-1), 4.65 (1H, d, J= 7.9 Hz, H-1'), 3.90 (1H, dd, J= 11.9/2.0 Hz, H-6'<sub>b</sub>), 3.82 (1H, m, H-7), 3.69 (3H, s,  $COOC\underline{H}_3$ ), 3.64 (1H, dd, J= 11.9/6.0 Hz, H-6'<sub>a</sub>), 3.50 (1H, m, H-5'), 3.46 (1H, t, J= 9.2 Hz, H-3'), 3.42 (1H, t, J= 9.0 Hz, H-4'), 3.20 (1H, dd, J= 7.9/9.5 Hz, H-2'), 3.05 (1H. m, H-5), 2.60 (1H, dt, J= 8.5/8.5/4.0 Hz, H-9), 2.13 (1H, m, H-8), 2.05 (1H, m, H-6<sub> $\beta$ </sub>), 1.83 (1H, m, H-6<sub> $\alpha$ </sub>), 1.04 (3H, d, J= 7.4 Hz, H<sub>3</sub>-10).

Auroside (2): UV, IR, and <sup>1</sup>H data were identical to those reported in the literature<sup>8,19</sup>.

Forsythoside B (3): UV, IR, and <sup>1</sup>H data were identical to those reported in the literature<sup>5,20</sup>.

Alyssonoside (4): UV, IR, and <sup>1</sup>H NMR data were identical to those reported in the literature<sup>5,21</sup>.

Verbascoside (5): UV, IR, and <sup>1</sup>H data were identical to those reported in the literature<sup>8,22</sup>.

**Hattushoside (6):** Positive ion ESI MS: m/z 635 [M+Na]<sup>+</sup>; negative ion ESI MS m/z 611 [M-H]<sup>-</sup> (calc. for  $C_{28}H_{36}O_{15}$ ); UV, IR, <sup>1</sup>H and <sup>13</sup>C NMR (Table) data were identical to those reported in the literature<sup>6</sup>.

Phlomisethanoside (7): Pale yellow, amorphous powder.  $[\alpha]_D^{25}$  –58.6°. UV  $\lambda_{max}$  (MeOH) nm: 222.5, 265, 286, 327; IR  $v_{max}$  (KBr) cm<sup>-1</sup>: 3400, 1699, 1620, 1518; positive ion ESI MS m/z 605 [M+Na]<sup>+</sup>, negative ion ESI MS m/z 581 [M-H]<sup>-</sup> (calc. for C<sub>27</sub>H<sub>34</sub>O<sub>14</sub>); <sup>1</sup>H and <sup>13</sup>C NMR (Table).

**Lamiide** (8): UV, IR, and <sup>1</sup>H data were identical to those reported in the literature<sup>5,23</sup>.

Syringaresinol-4'-O- $\beta$ -D-glucoside (9): UV, IR, <sup>1</sup>H and <sup>13</sup>C NMR data were identical to those reported in the literature<sup>24</sup>.

### Results and Discussion

From the aerial parts of *P. grandiflora* var. *fimbrilligera*, two iridoid glucosides, 8-*epi*-loganin (1) and auroside (2), and five phenylethanoid glycosides, forsythoside B (3), alyssonoside (4), verbascoside (5), hattushoside (6) and fimbrilloside (= phlomisethanoside) (7), were isolated by fractionation of the methanolic extract through a polyamide column, followed by silica gel CC. Compounds 2-6 were identified by comparing their spectral and physical data and by direct comparison with the authentic samples on a TLC plate, whereas the structures of 1 and 7 were identified based on the following evidence.

Compound 1 was obtained as an amorphous powder. Its UV and IR absorptions were typical of a conjugated enol-ether functional group. The  $^1\text{H}$  NMR spectrum of 1 exhibited characteristic signals for an iridoid structure with a methoxycarbonyl ( $\delta_H$  3.69, s), an oxymethine ( $\delta_H$  3.81, m) and a secondary methyl group ( $\delta_H$  1.04, d, J=7.4 Hz). Two hemiacetal proton signals at  $\delta_H$  5.51 (1H, d, J=4.0 Hz) and  $\delta_H$  4.65 (1H, d, J=7.9 Hz) were attributed to H-1 and the anomeric proton of a  $\beta$ -D-glucopyranose unit, respectively. The highly deshielded  $^1\text{H}$  NMR signal at  $\delta_H$  7.39 (1H, s) was assigned to H-3, suggesting a carbomethoxy substitution at C-4. The chemical shifts and the multiplicities of both H-3 and H-9 ( $\delta_H$  2.60, dt, J=8.5/8.5/4.0 Hz) indicated that the C-5 position of the iridoid aglycon is non-substituted. Therefore, the multiplet signal at  $\delta_H$  3.04 was assigned to H-5. Additionally, the H-7 proton signal showed a marked

downfield shift ( $\delta_H$  3.82, m), supporting the presence of oxygenation at C-7. The signals at  $\delta_H$  2.05 (m) and 1.83 (m) were readily attributed to the methylene protons at C-6. Moreover, the multiplet proton signal at  $\delta_H$  2.13 was assigned to H-8. The multiplicity of H-9 as well as the chemical shift value of H<sub>3</sub>-10 ( $\delta_H$  1.04) indicated the presence of a secondary methyl group at C-8. Based on the above results and comparison with the published data, compound 1 was identified as 8-epi-loganin<sup>19,25,26</sup>. 8-epi-loganin (1) was previously reported from Phlomis brachyodon<sup>19</sup> and P. grandiflora var grandiflora<sup>15</sup>.

**Table** <sup>13</sup>C and <sup>1</sup>H NMR Data of Phlomisethanoside (7) and Hattushoside (6)\* ( $\delta_C$  75.5 MHz;  $\delta_H$  300 MHz, CD<sub>3</sub>OD)

OCH,

The UV and IR spectroscopic data of 7 indicated its phenolic nature. The positive and negative ESI mass spectra exhibited quasimolecular ion peaks at m/z 605 [M+Na]<sup>+</sup> and 581 [M-H]<sup>-</sup>, respectively. These data were compatible with the molecular formula  $C_{27}H_{34}O_{14}$ . The <sup>1</sup>H and <sup>13</sup>C NMR data of 7 were almost identical to those of hattushoside (6)<sup>6</sup> (Table), except for the resonances due to an acyl moiety. The proton resonances attributed to the acyl group observed as a set of three signals appearing as an ABX system at  $\delta_H$  7.61 (dd, J = 1.8/8.3 Hz, H-6"'), 7.55 (d, J = 1.8 Hz, H-2"') and 6.83 (d, J = 8.3 Hz, H-5"') were indicative of a trisubstituted phenyl moiety in the structure of 7. Additionally, a methoxyl resonance was observed at  $\delta_H$  3.85 (3H, s,  $\delta_C$  56.47). These results together with the carbon resonances (Table) revealed the presence of a vanilloyl (3-hydroxy-4-methoxy-benzoic acid) moiety. Furthermore, in

the <sup>1</sup>H spectrum of 7 the resonances observed as  $A_2B_2$  type aromatic groups ( $\delta_H$  6.90 and 6.62, each 2H, d,  $J_{AB} = 8.5$  Hz, H-2/H-6 and H-3/H-5, respectively) and two methylene signals, which were coupled to each other ( $\delta_H$  3.94 and 3.52, each 1H, m, H<sub>2</sub>- $\alpha$ ;  $\delta_H$  2.71, 2H, t, J=7.6 Hz, H<sub>2</sub>- $\beta$ ), were consistent with the presence of a p-hydroxyphenethyl alcohol moiety. Further proof of this assumption was provided by the <sup>13</sup>C NMR data. Additionally, two proton signals at  $\delta_H$  4.29 (d, J=7.6 Hz) and  $\delta_H$  5.44 (br s) were attributed to the anomeric protons of  $\beta$ -linked glucose and  $\beta$ -linked apiose moieties, respectively. The <sup>13</sup>C NMR data also confirmed the diglycosidic structure, exhibiting two anomeric carbon resonances at  $\delta_C$  103.05 and 110.12, which were readily assigned to the glucose and apiose units, respectively. All proton resonances for the sugar units were assigned unambiguously from a COSY experiment of 7. The proton and carbon chemical shifts due to p-hydroxyphenethyl alcohol and the sugar moieties were in good agreement to those of hattushoside (6), indicating the same interglycosidic linkages and the site of acylation. However, the negative and positive ion ESI mass spectra of 7 indicated that the molecular weight of 7 was 28 mass units smaller than that of 6, confirming the proposed structure. Consequently, the structure of 7 was established to be (4-hydroxyphenyl) ethyl-(5-O-vanilloyl)- $\beta$ -D-apiofuranosyl- $(1\rightarrow 2)$ - $\beta$ -D-glucopyranoside. The trivial name fimbrilloside was proposed and reported for the glycoside<sup>13</sup>. However, Takeda et al. have also isolated a vanillic acid ester phenylethanoid glycoside, named phlomisethanoside, from P. grandiflora var. grandiflora<sup>9</sup>. We concluded that this compound must be identical to 7. A comparison of the spectroscopic data proved the identity of the two compounds.

Likewise, the aerial parts of P. fruticosa afforded two iridoid glucosides, auroside (2) and lamiide (8), as well as three phenylethanoid glycosides, forsythoside B (3), alyssonoside (4), and verbascoside (5), together with a lignan glucoside, syringaresinol-4'-O- $\beta$ -D-glucoside (9), by means of serial chromatographic separations. The identities of compounds 2-5, 8 and 9 were established by chromatography (TLC) and from the spectroscopic data. Although lamiide (8) was previously reported from P.  $fruticosa^{17}$ , this is the first report on the isolation of auroside (2) from the same plant. However, we failed to detect the presence of phlomiol<sup>17</sup>. No phenylethanoid glycoside had been reported from P. fruticosa. Therefore, forsythoside B (3), alyssonoside (4) and verbascoside (5) are the first phenylethanoid glycosides isolated from the title plant. Similarly, syringaresinol-4'-O- $\beta$ -D-glucopyranoside (9) was isolated for the first time from the genus Phlomis.

### Conclusion

In this study, we investigated the glycosidic constituents of two *Phlomis* taxa, *P. grandiflora* var. *fimbrilligera* and *P. fruticosa*, which both belong to the section *Phlomis*, subsection *Dendrophlomis*<sup>1</sup>. The occurrence of the iridoid glucoside, auroside (2), and phenylethanoid glycosides, forsythoside B (3), alyssonoside (4) and verbascoside (5) in both specimens, indicates that the iridoid and phenylethanoid compositions of these two investigated plants are somewhat similar. However, in addition to auroside, 8-*epi*-loganin (1) was isolated from *P. grandiflora* var. *fimbrilligera*, while lamiide (8) was identified from *P. fruticosa*. Phenylethanoid glycosides, hattushoside (6) and fimbrilloside (= phlomisethanoside) (7) were the additional glycosides in *P. grandiflora* var. *fimbrilligera*.

# Acknowledgments

The authors are grateful to Prof. Dr. Otto Sticher (ETHZ, Switzerland) and Prof. Dr. Yukio Ogihara (Nagoya City University, Japan) for the NMR measurements. We also thank Dr. Oswald Greter and Dr. Walter Amrein (ETHZ, Switzerland) for recording the mass spectra. Special thanks to Prof. Dr. Hayri Duman (Gazi University, Turkey) for supplying *P. fruticosa*. This work was financially supported by the Scientific and Technical Research Council of Turkey (TÜBİTAK Project No. SBAG-2304).
