#### Abstract

We define Lie subalgebras of the group algebra of a finite pseudoreflection group that are involved in the definition of the Cherednik KZsystems, and determine their structure. We provide applications for computing the Zariski closure of the image of generalized (pure) braid group $B$ inside the representations of the corresponding Hecke algebras. We also get unitarizability results for the representations of $B$ originating from Hecke algebras for suitable parameters, and relate our Lie algebras with the topological closure of $B$ in these compact cases.

MSC 2010 : 20C08, 20 F36.

## 1. Introduction

Let $V$ be a finite-dimensional complex vector space, and $W<\mathrm{GL}(V)$ a finite subgroup generated by pseudo-reflections, namely invertible endormorphisms of $V$ which fix some hyperplane. Such a group is called a (pseudo)reflection group. We denote by $\mathcal{R}$ the set of (pseudo-)reflections of $W$.

Among them are the 2-reflection groups, namely when $\forall s \in \mathcal{R} s^{2}=1$. Examples of 2 -reflection groups include the finite Coxeter groups. For a 2 -reflection group, we introduced in Ma03 the Lie subalgebra of the group algebra $\mathbb{C} W$ generated by $\mathcal{R}$, and call it the infinitesimal Hecke algebra. This is a reductive Lie algebra that appears naturally in the monodromy constructions of braid groups representations, also known as KZ systems. This Lie algebra was decomposed in Ma07a for the case of the symmetric group, and in Ma09a for the general case of 2-reflection groups. We proved in Ma09a that it can be identified with the Lie algebra of an interesting algebraic group, namely the Zariski closure of the image of the (generalized) braid group inside the generic Hecke algebra associated to $W$. It also admits a compact form that is relevant to the topological closure of the same group, under some conditions on the parameters involved.

The present paper is a continuation of Ma09a. Here we consider the general case of (pseudo-)reflection groups.

There are several natural generalizations of the infinitesimal Hecke algebras. The first one is the Lie subalgebra $\mathcal{H}$ of $\mathbb{C} W$ generated by the set

[^0]$\mathcal{R}$ of all reflections. A second one is the Lie subalgebra $\mathcal{H}_{s}$ generated by a subset $\mathcal{S} \subset \mathcal{R}$ which admit the following properties : it is invariant under $W$-conjugation, and $s \mapsto \operatorname{Ker}(s-1)$ induces a bijection from $\mathcal{S}$ to the reflecting hyperplanes.

For a conjugacy class $c \subset \mathcal{S}$, we let $e_{c}$ denote the order of the elements of $c$, and subdivide $\mathcal{S}=\mathcal{S}_{+} \sqcup \mathcal{S}_{0}$ with $e_{c}=2$ for $s \in \mathcal{S}_{0}$ and $e_{c}>2$ for $s \in \mathcal{S}_{+}$. We let $\mathcal{C}_{+}$denote the set of conjugacy classes in $\mathcal{S}_{+}$, and $\mathbb{A}(W)=\prod_{c \in \mathcal{C}_{+}} \mathbb{k}^{e_{C}-1}$ for a fixed field $\mathbb{k}$ of characteristic 0 . A typical element of $\mathbb{A}(W)$ is denoted $\underline{\boldsymbol{\lambda}}=\left(\underline{\lambda}^{c}\right)_{c \in \mathcal{C}_{+}}$, with $\underline{\lambda}^{c}=\left(\lambda_{1}^{c}, \ldots, \lambda_{e_{c_{-1}}}^{c}\right)$. We thus get a family of generalizations, that contains $\mathcal{H}_{s}$, by letting $\mathcal{H}(\underline{\boldsymbol{\lambda}})$ denote the Lie subalgebra of $\mathbb{k} W$ generated by $\mathcal{S}_{0}$ and the $\lambda_{1}^{c} s+\cdots+\lambda_{e_{c}-1}^{c} s^{e_{c}-1}$, for $s \in c \subset \mathcal{S}_{+}$.

From now on we assume that $W$ is not a 2 -reflection group, this case having been dealt with in Ma09a, and also that it is irreducible.

We introduce subsets $\overline{\text { QRef }, \mathcal{E}, \mathcal{F}}$ of the set $\operatorname{Irr}(W)$ of irreducible representations of $W$, as well as an equivalence relation $\approx \operatorname{in} \operatorname{Irr}(W)$. The central result is a structure theorem for $\mathcal{H}$, where we denote $V_{\rho}$ the underlying vector space of $\rho \in \operatorname{Irr}(W)$.

Theorem 1. $\mathcal{H}$ is a reductive Lie algebra whose center has dimension the cardinality $|\mathcal{R} / W|$ of conjugacy classes of reflections. Its semisimple part is

We then prove that there exists a dense open subset of $\mathbb{A}(W)$ over which $\mathcal{H}(\underline{\boldsymbol{\lambda}})$ has the same semisimple part as $\mathcal{H}$.

Theorem 2. The Lie algebras $\mathcal{H}$ and $\mathcal{H}(\underline{\boldsymbol{\lambda}})$ are reductive for all values of $\underline{\boldsymbol{\lambda}}$. There exists an hyperplane complement $\mathbb{A}(W)^{\times} \subset \mathbb{A}(W)$ such that, for all $\underline{\boldsymbol{\lambda}} \in \mathbb{A}(W)^{\times}$, $\mathcal{H}(\underline{\boldsymbol{\lambda}})$ has a center of dimension $|\mathcal{S} / W|$, and semisimple part $\mathcal{H}(\underline{\boldsymbol{\lambda}})^{\prime}=\mathcal{H}^{\prime}$

We then establish the connection between $\mathcal{H}(\underline{\boldsymbol{\lambda}})$ and the Zariski closure of the (pure) braid groups inside the Hecke algebra associated to $W$, and finally investigate several interesting cases for $\underline{\boldsymbol{\lambda}} \notin \mathbb{A}(W)^{\times}$:
(1) for the Lie algebra $\mathcal{H}_{s}$, whose parameter $\underline{\boldsymbol{\lambda}}$ does not always belong to $\mathbb{A}(W)^{\times}$;
(2) for the exceptional groups $G_{4}, G_{25}$, which are connected to the usual braid groups, we investigate the structure of $\mathcal{H}(\underline{\boldsymbol{\lambda}})$ for arbitrary $\underline{\boldsymbol{\lambda}} \in$ $\mathbb{A}(W)$;
(3) when $\underline{\boldsymbol{\lambda}}$ satisfies $\lambda_{i}^{c}=\lambda_{j}^{c}$, which corresponds to the 'spetsial' Hecke algebra of [BMM], we investigate $\mathcal{H}(\underline{\boldsymbol{\lambda}})$ for the groups $G(d, 1, r)$.
It has been noted in Ma09a that the infinitesimal Hecke algebras for 2 -reflection groups are actually generated by any set of reflections that generate the groups, e.g. a set of simple reflections for $W$ a finite Coxeter groups. Other generalizations to consider are then, for $\mathcal{U}$ a subset of $\mathcal{S}$ that generates the group and $\tilde{\mathcal{U}}=\left\{s^{k} \mid s^{k} \neq 1, s \in \mathcal{U}\right\} \subset \mathcal{R}$, the Lie algebras $\mathcal{H}(\mathcal{U})$ and $\mathcal{H}(\tilde{\mathcal{U}})$ generated by these subsets. Both Lie algebras are reductive.

We have $\mathcal{H}(\mathcal{U}) \subset \mathcal{H}_{s}$, and in general $\mathcal{H}_{s}^{\prime} \neq \mathcal{H}^{\prime}$, so $\mathcal{H}(\tilde{\mathcal{U}})$ is more likely to be considered as a natural generalization than $\mathcal{H}(\mathcal{U})$. Our last result on this topic is the following
Theorem 3. If $\mathcal{U} \subset \mathcal{S}$ generates $W$, then $\mathcal{H}(\mathcal{U})$ and $\mathcal{H}(\tilde{\mathcal{U}})$ are reductive, and $\mathcal{H}(\tilde{\mathcal{U}})^{\prime}=\mathcal{H}^{\prime}$.

In order to get this result, we study the following situation. For a finite group $G$, there are natural Lie-theoretic endomorphisms of $\operatorname{End}(\mathbb{C} G)$ associated to $g \in G$, namely $\operatorname{ad}(g): x \mapsto g x-x g$ and $\operatorname{Ad}(g): x \mapsto g x g^{-1}$. The technical result proved in the final section is the following.
Theorem 4. Let $k \geq 1$. There exists a rational polynomial $P \in \mathbb{Q}\left[X_{1}, \ldots, X_{k-1}\right]$ such that, for every finite group $G$ and $g \in G$ of order $k$, then $\operatorname{Ad}(g)=$ $P\left(\operatorname{ad}(g), \operatorname{ad}\left(g^{2}\right), \ldots, \operatorname{ad}\left(g^{k-1}\right)\right)$. Moreover $P$ can be taken in $\mathbb{Q}\left[X_{1}\right]$ if $k$ is odd or equal to 2.

The applications of these structure results on the Zariski closures of braid groups in their corresponding Hecke algebras, are discussed in §5 (see theorem (5.2). In $\S 6$ we prove that, for convenient values of the parameters and, if $W$ is irreducible, with the possible exception of a finite number of types, the representation of the Hecke algebra are unitarizable as representations of the corresponding braid group $B$ (theorem 6.1 and its corollary), and we relate the Lie algebra of the topological closure of $B$ in these compact cases with the Lie algebras introduced here.
Acknowledgements. I thank D. Juteau, J.-F. Planchat and K. Sorlin for useful discussions as well as E. Opdam for comments on a first version of this work.

## 2. Infinitesimal Hecke algebras

Let $W$ be a (pseudo-)reflection group, $\mathcal{R}$ its set of (pseudo-)reflections and $\mathcal{C}$ the set of conjugacy classes of reflection hyperplanes. We consider $\mathcal{S} \subset \mathcal{R}$ such that $\mathcal{S}$ is stabilized by conjugation under $W$ and generates $W$ as a group. We will show below that a consequence of this assumption and of Stanley's theorem (see [St], theorem 3.1) is that

$$
\forall s \in \mathcal{R} \exists s_{0} \in \mathcal{S} \exists r \geq 1 s=s_{0}^{r}
$$

Let $\mathbb{k}$ be a field of characteristic 0 . We introduce the Lie subalgebra $\mathcal{H}(\mathcal{S})$ of $\mathbb{k} W$ generated by $\mathcal{S}$ and, for $c$ a conjugacy class of $W$, we let $T_{c}=\sum_{w \in c} w \in \mathbb{k} W$.

We recall from Ma09a the following.
Proposition 2.1. (see Ma09a] prop. 2.2) The Lie algebra $\mathcal{H}(\mathcal{S})$ is reductive, and a basis of its center is given by the $T_{c}$ for $c \subset \mathcal{S}$. Every irreducible representation of $W$ induces an irreducible representation of $\mathcal{H}(\mathcal{S})$. The derived Lie algebra $\mathcal{H}(\mathcal{S})^{\prime}$ is generated by the $s^{\prime}=s-\left(T_{c}\right) /(\# c)$ for $s \in c$ a conjugacy class included in $\mathcal{S}$.

We say that a reflection is primitive if it generates the fixer of its reflecting hyperplane.

We assume that $\mathbb{k}$ is a field such that every ordinary representation of $W$ is realizable over $\mathbb{k}$ (this means that $\mathbb{k}$ contains the so-called field of definition
of $W$, by $[\mathrm{Bd}, \mathrm{Bes})$. Without loss of generality, we can assume that $\mathbb{k}$ is a number field, with $\mathbb{k} \subset \mathbb{C}$. Since $\mathcal{H}(\mathcal{S}) \subset \mathbb{k} W$, every such representation $\rho$ of $W$ induces a representation $\rho_{\mathcal{H}(\mathcal{S})}$ of $\mathcal{H}(\mathcal{S})$. Similarly, its restriction to $\mathcal{H}(\mathcal{S})^{\prime}$ is denoted $\rho_{\mathcal{H}(\mathcal{S})^{\prime}}$.

We let $\operatorname{Irr}(\rho)$ denote the set of irreducible representations of $W$, and define for $\rho \in \operatorname{Irr}(W)$ the set

$$
\mathrm{X}_{\mathcal{S}}(\rho)=\left\{\eta \in \operatorname{Hom}\left(W, \mathbb{k}^{\times}\right) \mid \forall s \in \mathcal{S} \quad \eta(s) \neq 1 \Rightarrow \rho(s) \in \mathbb{k}^{\times}\right\}
$$

Proposition 2.2. (1) For any $s \in \mathcal{R}$ there exists $s_{0} \in \mathcal{S}$ and $r \geq 1$ such that $s=s_{0}^{r}$.
(2) For any $\rho \in \operatorname{Irr}(W), \mathrm{X}(\rho)=\mathrm{X}_{\mathcal{S}}(\rho)$ does not depend on $\mathcal{S}$.

Proof. For $C$ of conjugacy class of hyperplanes in $W$ we denote $e_{C}$ the order of the fixer of an hyperplane in $C$. By Stanley's theorem there exists an isomorphism $\operatorname{Hom}\left(W, \mathbb{C}^{\times}\right) \simeq \prod_{C} \mathbb{Z} / e_{C} \mathbb{Z}$ where a primitive pseudo-reflection around $H$ in $C$ is mapped to a generator of $\mathbb{Z} / e_{C} \mathbb{Z}$. It follows that every pseudo-reflection $s \in \mathcal{R}$ around such an $H$ is mapped to some $x \in \mathbb{Z} / e_{C} \mathbb{Z}$. Since $\mathcal{S}$ generates $W$, there exists $s_{0} \in \mathcal{S}$ and $r \geq 1$ with $s_{0}^{r}$ having the same image as $s$ in $\mathbb{Z} / e_{C} \mathbb{Z}$. Since $\mathcal{S}$ is stable by conjugation we can assume that $s_{0}$ fixes the same hyperplane as $s$ hence $s_{0}^{r}=s$. This proves (1). We let $\mathcal{S}_{1}, \mathcal{S}_{2} \subset \mathcal{R}, \rho \in \operatorname{Irr}(W)$ and $\eta \in \mathrm{X}_{\mathcal{S}_{1}}(\rho)$. Let $s \in \mathcal{S}_{2}$ such that $\rho(s) \notin \mathbb{k}^{\times}$. By (1) we have $r \geq 1$ and $s_{0} \in \mathcal{S}_{1}$ such that $s=s_{0}^{r}$, so $\rho(s) \notin \mathbb{k}^{\times}$implies $\rho\left(s_{0}\right) \notin \mathbb{k}^{\times}$, hence $\eta\left(s_{0}\right)=1$ and $\eta(s)=1$. It follows that $\mathrm{X}_{\mathcal{S}_{1}}(\rho) \subset \mathrm{X}_{\mathcal{S}_{2}}(\rho)$ and $\mathrm{X}_{\mathcal{S}_{1}}(\rho)=\mathrm{X}_{\mathcal{S}_{2}}(\rho)$ whence $(2)$.

For $\mathcal{U} \subset \mathcal{R}$ not necessarily stable under conjugation, we may consider the Lie subalgebra $\mathcal{H}(\mathcal{U})$ of $\mathbb{k} W$ generated by $\mathcal{U}$. Letting $\tilde{\mathcal{U}}=\left\{s^{k} \in \mathcal{R} \mid s \in\right.$ $\mathcal{U}, k \geq 1\}$, we have the following, which shows that the stability under $W$ plays a role mainly for the center.

Proposition 2.3. If $\mathcal{U}$ generates $W$, then $\mathcal{H}(\mathcal{U})$ and $\mathcal{H}(\tilde{\mathcal{U}})$ are reductive, and $\mathcal{H}(\tilde{\mathcal{U}})^{\prime}=\mathcal{H}^{\prime}$.

Proof. We decompose $\mathbb{k} W=Z(\mathbb{k} W) \oplus(\mathbb{k} W)^{\prime}$ as a Lie algebra. Then $Z(\mathbb{k} W)$ and $(\mathbb{k} W)^{\prime}$ are ideals of $\mathbb{k} W$ as an associative algebra, and there exists a $W$-equivariant idempotent $p=\mathbb{k} W \rightarrow Z(\mathbb{k} W)$. Since $\mathcal{U}$ and $\tilde{\mathcal{U}}$ generate $\mathcal{H}(\mathcal{U})$ and $\mathcal{H}(\tilde{\mathcal{U}})$, respectively, both Lie algebras are reductive (see Ma09a prop. 2.2). Now $\mathcal{R}=\left\{w s w^{-1} \mid s \in \mathcal{U}, w \in W\right\}$ by Stanley theorem, hence $\mathcal{H}$ is generated by the $\mathcal{H}\left(w \tilde{\mathcal{U}} w^{-1}\right)$ for $w \in W$. Since $\tilde{\mathcal{U}}$ generates $W$, $Z(\mathcal{H}(\tilde{\mathcal{U}})) \subset Z(\mathbb{k} W)$, hence $p(Z(\mathcal{H}(\tilde{\mathcal{U}})))=\{0\}$. From the reductiveness of $\mathcal{H}(\tilde{\mathcal{U}})$ we get $\mathcal{H}(\tilde{\mathcal{U}})=Z(\mathcal{H}(\tilde{\mathcal{U}})) \oplus \mathcal{H}(\tilde{\mathcal{U}})^{\prime}$, hence $p(\mathcal{H}(\tilde{\mathcal{U}}))=p\left(\mathcal{H}(\tilde{\mathcal{U}})^{\prime}\right)=\mathcal{H}(\tilde{\mathcal{U}})^{\prime}$, as $\mathcal{H}(\tilde{\mathcal{U}})^{\prime} \subset(\mathbb{k} W)^{\prime}$. More generally,

$$
p\left(\mathcal{H}\left(w \tilde{\mathcal{U}} w^{-1}\right)\right)=\mathcal{H}\left(w \tilde{\mathcal{U}} w^{-1}\right)=w \mathcal{H}(\tilde{\mathcal{U}})^{\prime} w^{-1}=\operatorname{Ad}(w)\left(\mathcal{H}(\tilde{\mathcal{U}})^{\prime}\right)
$$

Let now $s \in \mathcal{U}$. The endomorphism $\operatorname{ad}\left(s^{k}\right) \in \operatorname{End}(\mathbb{k} W)$ stabilizes $\mathcal{H}(\tilde{\mathcal{U}})$ hence $\mathcal{H}(\tilde{\mathcal{U}})^{\prime}$, as $\mathcal{H}(\tilde{\mathcal{U}})=Z(\mathcal{H}(\tilde{\mathcal{U}})) \oplus \mathcal{H}(\tilde{\mathcal{U}})^{\prime}$ and $s^{k} \in \tilde{\mathcal{U}}$. We will prove later (theorem 8.6) that $\operatorname{Ad}(s)$ can be written as a rational polynomial in $\operatorname{ad}(s), \ldots, \operatorname{ad}\left(s^{k}\right), \ldots$, hence $s \mathcal{H}(\tilde{\mathcal{U}})^{\prime} s^{-1} \subset \mathcal{H}(\tilde{\mathcal{U}})^{\prime}$. Since $\operatorname{Ad}(s)$ is invertible, it follows that $s \mathcal{H}(\tilde{\mathcal{U}})^{\prime} s^{-1}=\mathcal{H}(\tilde{\mathcal{U}})$. Since $\mathcal{U}$ generates $W$ we get
$w \mathcal{H}(\tilde{\mathcal{U}})^{\prime} w^{-1}=\mathcal{H}(\tilde{\mathcal{U}})^{\prime}$ for all $w \in W$. Then $p\left(\mathcal{H}\left(w \tilde{\mathcal{U}} w^{-1}\right)\right)=\mathcal{H}(\tilde{\mathcal{U}})^{\prime}$ hence $\mathcal{H}^{\prime}$ is generated by $\mathcal{H}(\tilde{\mathcal{U}})^{\prime}$, that is $\mathcal{H}^{\prime}=\mathcal{H}(\tilde{\mathcal{U}})^{\prime}$.

For $\rho \in \operatorname{Irr}(W)$ we let $V_{\rho}$ denote its underlying vector space. We define the following subsets of $\operatorname{Irr}(W)$.

Ref $=\{\rho \in \operatorname{Irr}(W) \mid \operatorname{dim} \rho \geq 2$ and $\forall s \in \mathcal{S} \rho(s) \neq 1 \Rightarrow \rho(s)$ is a reflection $\}$
QRef $=\left\{\eta \otimes \rho \mid \rho \in \operatorname{Ref}, \eta \in \operatorname{Hom}\left(W, \mathbb{k}^{\times}\right)\right\}$
$\Lambda \operatorname{Ref}=\left\{\eta \otimes \Lambda^{k} \rho \mid \rho \in \operatorname{Ref}, \eta \in \operatorname{Hom}\left(W, \mathbb{k}^{\times}\right), k \geq 0\right\}$
The statements and proofs of the propositions 2.13 and 2.15 in Ma09a admit a natural generalization.

## Proposition 2.4.

(1) If $\rho \in \operatorname{Ref}(W)$ and $\eta \in \operatorname{Hom}\left(W, \mathbb{k}^{\times}\right)$, then $\Lambda^{k}\left((\rho \otimes \eta)_{\mathcal{H}(\mathcal{S})^{\prime}}\right)=(\eta \otimes$ $\left.\Lambda^{k} \rho\right)_{\mathcal{H}(\mathcal{S})^{\prime}}$.
(2) If $\rho \in \operatorname{QRef}(W)$ then $\rho\left(\mathcal{H}(\mathcal{S})^{\prime}\right)=\mathfrak{s l}\left(V_{\rho}\right)$.

Proof. Let $\rho \in \operatorname{Ref}(W)$, and $s \in \mathcal{S}$. If $\rho(s)=1$ then $\left(\eta \otimes \Lambda^{k} \rho\right)(s)=\eta(s)$ and $\Lambda^{k}(\rho \otimes \eta)(s)=k \eta(s)=(k-1) \eta(s)+\left(\eta \otimes \Lambda^{k} \rho\right)(s)$. Otherwise, there exists a basis $e_{1}, \ldots, e_{n}$ of $V_{\rho}$ such that s. $e_{1}=\zeta e_{1}$ and $s . e_{i}=e_{i}$ if $i \neq 1$ for $\zeta$ some nontrivial root of 1. Taking for basis of $\Lambda^{k} V_{\rho}$ the basis $e_{I}=e_{i_{1}} \wedge \cdots \wedge e_{i_{k}}$ for $I=\left\{i_{1}, \ldots, i_{k}\right\} \subset[1 . . n]$ of cardinality $k$ with $i_{1}<\cdots<i_{k}$ we get that $\left(\eta \otimes \Lambda^{k} \rho\right)(s)$ maps $e_{I}$ to $\eta(s) e_{I}$ if $1 \notin I$ and to $\eta(s) \zeta e_{I}$ if $1 \in I$. Similarly, $\Lambda^{k}\left((\rho \otimes \eta)_{\mathcal{H}(\mathcal{S})}\right)$ maps $e_{I}$ to $k \eta(s) e_{I}$ if $1 \notin I$ and to $\eta(s)(k-1+\zeta) e_{I}$ otherwise. It follows that $\Lambda^{k}\left((\rho \otimes \eta)_{\mathcal{H}(\mathcal{S})}(s)=\eta(s)(k-1) \operatorname{Id}+\left(\eta \otimes \Lambda^{k} \rho\right)(s)\right.$ for all $s \in \mathcal{S}$, which easily implies $\Lambda^{k}\left((\rho \otimes \eta)_{\mathcal{H}(\mathcal{S})^{\prime}}=\left(\eta \otimes \Lambda^{k} \rho\right)_{\mathcal{H}(\mathcal{S})^{\prime}}\right.$ and proves (1). It is clearly enough to prove (2) for $\rho \in$ Ref. Since $\rho(W)$ is an irreducible reflection group, we can also assume that $\rho$ is faithful. We proceed by induction on the rank $n=\operatorname{dim} V_{\rho}$ of $W$ for $n \geq 1$, the case $n=1$ being trivial, so we assume $n \geq 2$. Let $W_{0} \subset W$ be a maximal parabolic subgroup which acts irreducibly on some hyperplane $H$ of $V_{\rho}$ (see Ma09a] lemma 2.17). The image $\mathfrak{g}$ of $\mathcal{H}(\mathcal{S})^{\prime}$ in $\mathfrak{s l}\left(V_{\rho}\right)$ contains $\mathfrak{s l}(H)$, hence a Cartan subalgebra of rank $n-2$. Since $n \geq 2$, there exists $s \in \mathcal{S} \cap W_{0}$ with $\rho(s) \notin \mathbb{k}^{\times}$. Let $\zeta \neq 1$ with $\zeta \in \operatorname{Sp}(s)$. We denote $c_{0}$ the conjugacy class of $s$ in $W_{0}$ and $c$ its class in $W, T_{0}=\sum_{g \in c_{0}} g, T=\sum_{g \in c} g$. Since $T$ is central in $\mathcal{H}(\mathcal{S})$ and $\rho$ is irreducible, $\rho(T)$ is a scalar determinated by its trace $(\# c)(n-1+\zeta)$. Similarly, $\rho\left(T_{0}\right)$ has for trace $\left(\# c_{0}\right)(n-1+\zeta)$, acts on $H$ by $\left(\# c_{0}\right)(n-2+\zeta) /(n-1)$ and on its orthogonal supplement by $\# c_{0}$. Letting $X=(\# c) T_{0}-\left(\# c_{0}\right) T$ we get that $x=\rho(X)$ has zero trace, belongs to $\mathfrak{s l}\left(V_{\rho}\right) \cap \rho(\mathcal{H}(\mathcal{S}))=\rho\left(\mathcal{H}(\mathcal{S})^{\prime}\right)$ (since $\mathcal{H}(\mathcal{S})$ is reductive), is semisimple and centralizes the Cartan of $\mathfrak{s l}(H)$. It follows that the semisimple Lie algebra $\mathfrak{g}$ contains a Cartan subalgebra of rank $n-1$. Since $\mathfrak{s l}_{n}$ contains no proper root system of rank $n-1$ (see Ma09a, lemma 2.16) it follows that $\mathfrak{g}=\mathfrak{s l}\left(V_{\rho}\right)$, and this proves (2) by induction.

We now focus on two special cases, fixing $\mathcal{S}$ to be minimal, for instance by letting $\mathcal{S}$ being the set of distinguished pseudo-reflections. We denote $\mathcal{H}_{s}=\mathcal{H}(\mathcal{S})$, the letter 's' being understood as the 'special' infinitesimal Hecke algebra. The second one is for $\mathcal{S}$ maximal; we let $\mathcal{H}=\mathcal{H}(\mathcal{R})$ and call
it the ambient infinitesimal Hecke algebra. We denote $\mu_{\infty}(\mathbb{C})$ the group of roots of 1 .
Lemma 2.5. Let $\mathcal{X} \subset \mu_{\infty}(\mathbb{C})$ and $\omega \in \mathbb{C}^{\times}$such that $\omega+\mathcal{X} \subset \mu_{\infty}$. Then $|\mathcal{X}| \leq 2$ and, if $|\mathcal{X}|=2$ with $\mathcal{X}=\{\alpha, \beta\}$, then $\omega=-\alpha-\beta$.
Proof. This is a consequence of the fact that, if $\alpha, \beta \in \mathbb{C}$ with $\alpha \neq \beta$, then the equation $|\alpha+z|^{2}=|\beta+z|^{2}=1$ has at most two solutions; for $|\alpha|=|\beta|=1$ these solutions are 0 and $-\alpha-\beta$. Since $\omega \neq 0, \alpha, \beta, \gamma \in \mathcal{X}$ would imply $\alpha+\beta=\alpha+\gamma$ hence $\beta=\gamma$ and $|\mathcal{X}| \leq 2$.
Proposition 2.6. (1) If $\rho^{1}, \rho^{2} \in \operatorname{Irr}(W)$ then $\rho^{1} \simeq \rho^{2} \Leftrightarrow\left(\rho^{1}\right)_{\mathcal{H}} \simeq$ $\left(\rho^{2}\right)_{\mathcal{H}}$.
(2) If $\rho^{1}, \rho^{2} \in \operatorname{Irr}(W)$ with $\operatorname{dim} \rho^{i}>1$, then $\rho_{\mathcal{H}^{\prime}}^{1} \simeq \rho_{\mathcal{H}^{\prime}}^{2}$ iff $\rho^{2} \simeq \rho^{1} \otimes \eta$ for some $\eta \in \mathrm{X}(\rho)$.
Proof. (1) is a direct consequence of the fact that $\mathcal{H}$ and $W$ are both generated by $\mathcal{R}$. For (2), we assume that $\left(\rho^{1}\right)_{\mathcal{H}^{\prime}}$ and $\left(\rho^{2}\right)_{\mathcal{H}^{\prime}}$ are irreducible and identify the underlying vector spaces of $\rho^{1}, \rho^{2}$. Denoting it by $V$, there exists $P \in \operatorname{GL}(V)$ with $P \rho^{2}\left(s^{\prime}\right) P^{-1}=\rho^{1}\left(s^{\prime}\right)$ for each $s \in \mathcal{R}$, with $s^{\prime}=s-(1 / N) T_{s}$, $N$ the cardinality of the conjugacy class $c$ of $s$ and $T_{s}=\sum_{g \in c} g$. Since $\rho^{1}, \rho^{2}$ are irreducibles we have $T_{s} \in \mathbb{k}$. We let $\omega_{s}=\left(\rho^{2}\left(T_{s}\right)-\rho^{1}\left(T_{s}\right)\right) / N$, so that $P \rho^{2}(s) P^{-1}=\rho^{1}(s)+\omega_{s}$. Raising the previous equation to the square we get $P \rho^{2}\left(s^{2}\right) P^{-1}=\rho^{1}\left(s^{2}\right)+2 \omega_{s} \rho^{1}(s)+\omega_{s}^{2}$. We apply this to some $s \in \mathcal{S}$. If $s^{2}=1$, then we have $1=1+2 \omega_{s} \rho^{1}(s)+\omega_{s}^{2}$ hence $\omega_{s}=0$ or $\rho^{1}(s)=-\omega_{s} / 2 \in \mathbb{k}^{\times}$. Otherwise, $s^{2} \in \mathcal{R}$ hence $P \rho^{2}\left(s^{2}\right) P^{-1}=\rho^{1}\left(s^{2}\right)+\omega_{s^{2}}$ and $\omega_{s^{2}}=2 \omega_{s} \rho^{1}(s)+\omega_{s}^{2}$, so also in this case $\omega_{s}=0$ or $\rho^{1}(s) \in \mathbb{K}^{\times}$.

For $C$ the set of conjugacy classes of hyperplanes we define $J \subset C$ by $c \in J$ iff the corresponding $s \in \mathcal{S}$ satisfy $\omega_{s} \neq 0$. For such an $s$ we define $\eta(s) \in \mathbb{k}^{\times}$ by $\rho^{2}(s)=\rho^{1}(s) \eta$, and define $\eta(s)=1$ otherwise. Stanley's theorem extends this formula to a character $\eta \in \operatorname{Hom}\left(W, \mathbb{k}^{\times}\right)$such that $\rho^{2} \simeq \rho^{1} \otimes \eta$ with $\eta \in \mathrm{X}\left(\rho^{1}\right)$. Conversely, if $\rho^{2}=\rho^{1} \otimes \eta$ with $\eta \in \mathrm{X}\left(\rho^{1}\right)$ and $s \in \mathcal{R}$, then either $\rho^{2}(s)=\rho^{1}(s)$, or $\rho^{2}(s), \rho^{1}(s) \in \mathbb{k}^{\times}$hence $\rho^{1}(s) \eta(s)=\rho^{1}(s)+\omega$ for some $\omega \in \mathbb{C}^{\times}$, which implies $\rho^{2}\left(s^{\prime}\right)=\rho^{1}\left(s^{\prime}\right)$. This concludes the proof of (2).
Proposition 2.7. Let $\rho \in \operatorname{Irr}(W)$. There exists $\rho^{1} \in \operatorname{Irr}(W)$ such that $\rho_{\mathcal{H}_{s}^{\prime}}^{1} \simeq\left(\rho_{\mathcal{H}_{s}^{\prime}}\right)^{*}$ if and only if, for any $s \in \mathcal{S}, \rho(s)$ has at most two eigenvalues. In that case, $\rho^{1} \simeq \rho^{*} \otimes \chi$ with $\chi \in \operatorname{Hom}\left(W, \mathbb{k}^{\times}\right)$and $\chi(s)$ for $s \in \mathcal{S}$ is equal to the product of the eigenvalues of $\rho(s)$ whenever $\rho(s)$ has two distinct ones ; moreover, one also has $\rho_{\mathcal{H}^{\prime}}^{1} \simeq\left(\rho^{*}\right)_{\mathcal{H}^{\prime}}$.
Proof. We assume $\rho_{\mathcal{H}_{s}^{\prime}}^{1} \simeq\left(\rho_{\mathcal{H}_{s}^{\prime}}\right)^{*}$, and identify the underlying vector space with a common $\mathbb{k}^{n}$. Let $s \in \mathcal{S}$ and $X=\rho(s), Y=\rho^{1}(s)$. We have $P \in$ $\mathrm{GL}_{n}(\mathbb{k})$ independent from $s$ with $P \rho^{1}\left(s^{\prime}\right) P^{-1}=-^{t} \rho\left(s^{\prime}\right)$ i.e. $P Y P^{-1}=$ $-^{t} X+\omega_{s}$ with $\omega_{s}=(1 / \# c)\left(\rho^{1}(T)+\rho(T)\right), c$ being the conjugacy class of $s, T=\sum_{g \in c} g$.

We assume $\omega_{s} \neq 0$ and let $n$ denote the order of $s$. From $P Y P^{-1}=$ $-^{t} X+\omega_{s}$ and $\omega_{s}-\operatorname{Sp}(X) \subset \mu_{\infty}$ we get from lemma 2.5 that $|\operatorname{Sp} X| \leq 2$ and, if $\operatorname{Sp}(X)=\{\alpha, \beta\}$ with $\alpha \neq \beta$, we have $\omega_{s}=\alpha+\beta$ hence, since $X$ is semisimple, $\omega_{s}-X=\beta \alpha X^{-1}$, whence $P Y P^{-1}=u_{s}^{t} X^{-1}$ for some $u_{s} \in \mu_{n}$; similarly, if $|\operatorname{Sp}(X)|=1$, then $P Y P^{-1}=u_{s}^{t} X^{-1}$ for some $u_{s} \in \mu_{n}$. Then $s^{k} \mapsto u_{s}^{k}$ defines a character of the subgroup generated by $s$.

Let now $\chi \in \operatorname{Hom}\left(W, \mathbb{k}^{\times}\right)$defined by $\chi(s)=-1$ if $\omega_{s}=0$ or $s^{2}=1$, $\chi(s)=u_{s}$ for $\rho(s) \in \mathbb{k}^{\times}$with $u$ defined as above, and otherwise $\chi(s)$ equal to the product of the eigenvalues of $\rho(s)$. We then have $\rho^{1} \simeq \chi \otimes \rho^{*}$ and conversely, if $\rho^{1}=\chi \otimes \rho^{*}$ with such a $\chi$, then it is easily checked that $\left(\rho^{1}\right)_{\mathcal{H}^{\prime}} \simeq\left(\rho^{*}\right)_{\mathcal{H}^{\prime}}$.

Note that any two $\chi$ as in the above statement are deduced from each other by tensoring by some $\eta \in \mathrm{X}\left(\rho^{1}\right)$.

We define an equivalence relation $\approx$ on $\operatorname{Irr}(W)$ generated by $\rho^{1} \approx \rho^{2}$ for $\rho^{2}=\rho^{1} \otimes \eta, \eta \in \mathrm{X}\left(\rho^{1}\right)$, and $\rho^{2}=\left(\rho^{1}\right)^{*} \otimes \chi$ for a $\chi$ as in proposition 2.7, We let QRef a set of representatives in QRef of QRef/ $\approx$, and subdivide $\operatorname{Irr}(W) \backslash \Lambda \operatorname{Ref}=\mathcal{E} \sqcup \mathcal{F}$ with $\mathcal{F}$ the $\rho$ such that $\rho_{\mathcal{H}^{\prime}} \simeq\left(\rho_{\mathcal{H}}^{\prime}\right)^{*}$. We identify $\mathcal{E} / \approx$ and $\mathcal{F} / \approx$ with some subset of representatives. Finally, if $\rho_{\mathcal{H}^{\prime}} \simeq \rho_{\mathcal{H}^{\prime}}^{*}$, there exists a nondegenerate bilinear form over $V_{\rho}$ preserved by $\rho\left(\mathcal{H}^{\prime}\right)$. We say that $\rho \in \operatorname{Irr}(W)$ is of orthogonal type if this bilinear form is symmetric, and of symplectic type otherwise, namely if this bilinear form is skew-symmetric. In both cases, we denote the corresponding orthogonal or symplectic algebra by $\mathfrak{o s p}\left(V_{\rho}\right)$.

We now define the following Lie algebra
and embed $\mathcal{M}$ inside $\mathbb{k} W$ in the obvious way. For instance, if $\rho_{0}$ is a representative of some class in $\mathcal{E}$, then the $\mathfrak{s l}\left(V_{\rho}\right)$ factor in $\mathcal{M}$ is identified with a diagonal factor $\bigoplus_{\rho \approx \rho_{0}} \mathfrak{s l}\left(V_{\rho}\right)$ using the isomorphisms $\rho_{\mathcal{H}^{\prime}} \simeq \rho_{\mathcal{H}^{\prime}}^{0}$ or $\rho_{\mathcal{H}^{\prime}}^{*} \simeq\left(\rho_{\mathcal{H}^{\prime}}^{0}\right)^{*}$.

By the above propositions, we have $\mathcal{H}^{\prime} \subset \mathcal{M}$. In the next section we will prove the following theorem.
Theorem 2.8. If $W$ is irreducible and $W \neq H_{4}$, then $\mathcal{H}^{\prime}=\mathcal{M}$.
The proof of the following lemma is postponed to the next section.
Lemma 2.9. Let $W$ be irreducible and not a 2-reflection group. Let $\rho \notin$ $\Lambda$ Ref with $\rho_{\mathcal{H}^{\prime}} \simeq\left(\rho_{\mathcal{H}^{\prime}}\right)^{*}$. Then $\operatorname{dim} \rho$ is an even integer and, if $\operatorname{dim} \rho \in$ $\{4,6,8\}$, then $\rho$ is of symplectic type.

Let $\mathfrak{g} \subset \mathcal{M}(\rho)$ a semisimple Lie subalgebra of $\mathcal{M}$. For all $\rho \in \operatorname{Irr}(W)$, we denote $\mathcal{M}(\rho)$ and $\mathfrak{g}(\rho)$ the simple Lie ideal of $\mathcal{M}$ and $\mathfrak{g}$, respectively, that corresponds to $\rho$, i.e. the orthogonal w.r.t. the Killing form of the kernel of $\rho$ for the corresponding Lie algebras. We have clearly $\mathcal{M}(\rho) \simeq \mathfrak{s l}\left(V_{\rho}\right)$ for $\rho \in \mathcal{E}$ and $\mathcal{M}(\rho) \simeq \mathfrak{o s p}\left(V_{\rho}\right)$ for $\rho \in \mathcal{F}$. By the above lemma, all these Lie ideals are simple, as the non-simple case $\mathfrak{s o}_{4} \simeq \mathfrak{s l}_{2} \times \mathfrak{s l}_{2}$ does not arise.

Lemma 2.10. Let $W$ be irreducible and not a 2-reflection group. If we have
(1) For all $\rho \in \operatorname{Irr}(W), \rho(\mathcal{M}) \simeq \rho(\mathfrak{g})$
(2) $\rho_{\mathfrak{g}}^{1} \simeq \rho_{\mathfrak{g}}^{2}$ iff $\rho_{\mathcal{M}}^{1} \simeq \rho_{\mathcal{M}}^{2}$
(3) $\rho_{\mathfrak{g}}^{1} \simeq\left(\rho_{\mathfrak{g}}^{2}\right)^{*}$ iff $\rho_{\mathcal{M}}^{1} \simeq\left(\rho_{\mathcal{M}}^{2}\right)^{*}$
then $\mathfrak{g}=\mathcal{M}$.

Proof. Let $\mathcal{X}=\overline{\mathrm{QRef}} \cup \mathcal{E} / \approx \cup \mathcal{F} / \approx$, so that $\mathcal{M}=\bigoplus_{\rho \in \mathcal{X}} \mathcal{M}(\rho)$.
Each of the $\rho \in \operatorname{Irr}(W)$ provides a Lie ideal $\mathfrak{g}(\rho)$ of $\mathfrak{g}$, namely the orthogonal of Ker $\rho_{\mathfrak{g}}$ w.r.t. the Killing form of $\mathfrak{g}$, which is isomorphic to $\rho(\mathfrak{g})$, which is isomorphic to $\rho(\mathcal{M})$ by (1) and simple by the above lemma, as the case $\mathfrak{s o}_{4}$ is excluded. Moreover, the type of $\rho(\mathfrak{g})$, for $\mathfrak{g} \in \mathcal{X}$, determines $\operatorname{dim} \rho$ by the above lemma, as the exceptional isomorphisms $\mathfrak{s o}_{3} \simeq \mathfrak{s l}_{2}$ and $\mathfrak{s o}_{6} \simeq \mathfrak{s l}_{4}$ are excluded by the lemma for $\rho \notin \Lambda \operatorname{Ref}$, and $\Lambda \operatorname{Ref} \cap \mathcal{X}=\overline{\text { QRef. }}$.

Let $\rho^{1}, \rho^{2} \in \mathcal{X}$ such that $\mathfrak{g}\left(\rho^{1}\right)=\mathfrak{g}\left(\rho^{2}\right)$. This is possible if and only if $\rho^{1}$ and $\rho^{2}$ have the same dimension, say $N$. But the simple Lie ideals involved here have at most 2 irreducible representations of dimension $N$, as the exceptional case $\mathfrak{s o}_{8}$ is excluded. Moreover, when there are two of them, one is the dual of the other. Thus $\rho_{\mathfrak{g}}^{1} \simeq \rho_{\mathfrak{g}}^{2}$ or $\rho_{\mathfrak{g}}^{1} \simeq\left(\rho_{\mathfrak{g}}^{2}\right)^{*}$. If $\rho_{\mathfrak{g}}^{1} \simeq \rho_{\mathfrak{g}}^{2}$ or $\rho_{\mathfrak{g}}^{1} \simeq\left(\rho_{\mathfrak{g}}^{2}\right)^{*}$, by (2) and (3) we have $\rho^{1}=\rho^{2}$, as $\rho^{1}, \rho^{2} \in \mathcal{X}$. Then $\mathfrak{g}=\bigoplus_{\rho \in \mathcal{X}} \mathfrak{g}(\rho) \simeq \bigoplus_{\rho \in \mathcal{X}} \rho(\mathcal{M}) \simeq \mathcal{M}$, hence $\operatorname{dim} \mathfrak{g}=\operatorname{dim} \mathcal{M}$ and $\mathfrak{g}=\mathcal{M}$.

Example for $G_{25}$. We first describe $\operatorname{Irr}(W)$ for $W$ of type $G_{25}$. Let $j=$ $\exp (2 \mathrm{i} \pi / 3)$, and choose $s \in \mathcal{S}$. It has order 3 , and there is only one conjugacy class of hyperplanes for $W$, so there are exactly 3 one-dimensional $S_{\alpha}: W \rightarrow$ $\mathbb{k}^{\times}$and $\mathrm{X}(\rho)=\left\{S_{1}\right\}$ for every $\rho \in \operatorname{Irr}(W)$ with $\operatorname{dim} \rho \geq 2$. The 24 irreducible representations are described in the following table.

| Dim. | Name | Parameters | $\operatorname{Sp}(s)$ |
| :--- | :--- | :--- | :--- |
| 1 | $S_{\alpha}$ | $\alpha \in \mu_{3}$ | $(\alpha)$ |
| 2 | $U_{\alpha, \beta}$ | $\{\alpha, \beta\} \subset \mu_{3}, \alpha \neq \beta$ | $(\alpha, \beta)$ |
| 3 | $U_{\alpha, \beta}^{\prime}$ | $(\alpha, \beta) \in\left(\mu_{3}\right)^{2}, \alpha \neq \beta$ | $(\alpha, \alpha, \beta)$ |
| 3 | $V^{2}$ |  | $\left(1, j, j^{2}\right)$ |
| 6 | $V_{\alpha, \beta}$ | $(\alpha, \beta) \in\left(\mu^{3}\right)^{2}, \alpha \neq \beta$ | $(\alpha, \alpha, \alpha, \beta, \beta, \gamma)$ |
| 8 | $W_{\alpha}$ | $\alpha \in \mu_{3}$ | $(\alpha, \alpha, \alpha, \alpha, \beta, \beta, \gamma, \gamma)$ |
| 9 | $X$ |  | $(\alpha, \alpha, \alpha, \beta, \beta, \beta, \gamma, \gamma, \gamma)$ |
| 9 | $X^{*}$ |  | $(\alpha, \alpha, \alpha, \beta, \beta, \beta, \gamma, \gamma, \gamma)$ |

From these datas, we get that $\Lambda \operatorname{Ref}=\left\{S_{\alpha}, U_{\alpha, \beta}, U_{\alpha, \beta}^{\prime} \mid \alpha, \beta \in \mu_{3}\right\}$, and QRef $=\left\{U_{\alpha, \beta}, U_{\alpha, \beta}^{\prime} \mid \alpha, \beta \in \mu_{3}\right\}$. Moreover $U_{\alpha, \beta}^{\prime} \approx U_{\beta, \alpha}^{\prime}$ is the only nontrivial identification in QRef $/ \approx$. We will prove later on (see proposition 7.1) that the identifications are the same for $\mathcal{H}_{s}^{\prime}$ and $\mathcal{H}^{\prime}$, since every pseudo-reflection has odd order. It follows that the reflection ideal is made out of simple ideals $\mathfrak{s l}_{2}$ and $\mathfrak{s l}_{3}$ for each pair $\{\alpha, \beta\}$ and is isomorphic to $\mathfrak{s l}_{2}^{3} \times \mathfrak{s l}_{3}^{3}$. Outside $\Lambda$ Ref, each $N$-dimensional representation corresponds to a distinct ideal $\mathfrak{s l}_{N}$, $N \in\{6,8,9\}$, so

$$
\mathcal{H}_{s}^{\prime} \simeq \mathcal{H}^{\prime} \simeq \mathfrak{s l}_{2}^{3} \times \mathfrak{s l}_{3}^{4} \times \mathfrak{s l}_{6}^{6} \times \mathfrak{s l}_{8}^{3} \times \mathfrak{s l}_{9}^{2}
$$

## 3. Proof of the structure Theorem

We prove theorem 2.8 separately for the infinite series and for the exceptional groups. Since this theorem is known to hold for $W$ a 2-reflection group by Ma09a, we assume that $W$ is not such a group.

In order to prove the theorem, by lemma 2.10, we only need to prove lemma 2.9 as well as the following one.

Lemma 3.1. Let $W$ be an irreducible reflection group which is not a 2reflection group. For any $\rho \notin \Lambda \operatorname{Ref}, \rho\left(\mathcal{H}_{s}^{\prime}\right)=\mathfrak{o s p}\left(V_{\rho}\right)$ if $\rho_{\mathcal{H}^{\prime}} \simeq\left(\rho_{\mathcal{H}^{\prime}}\right)^{*}$ and $\rho\left(\mathcal{H}_{s}^{\prime}\right)=\mathfrak{s l}\left(V_{\rho}\right)$ otherwise.

We prove both lemmas in the two cases of the general series and the exceptional cases.
3.1. The infinite series $G(d e, e, r)$. We let $W=G(d e, e, r)$ and $W_{0}=$ $G(d e, d e, r)$. Since $W_{0}$ is a 2-reflection group, the structure of its infinitesimal Hecke algebre $\mathcal{H}_{0} \subset \mathcal{H}_{s}$ is known by Ma09a]. Recall that $W_{0}$ is an index $d$ subgroup of $W$, and that $W=W_{0} \rtimes<t>$ where $t \in \mathcal{S}$ is the pseudo-reflection $\operatorname{diag}(\zeta, 1, \ldots, 1)$ for $\zeta$ some primitive $d$-th root of 1 . We let $\alpha: W \rightarrow \mu_{d}$ with kernel $W_{0}, \alpha(t)=\zeta$. When needed, we will use the standard labelling by de-tuples of partitions of total size $r$ of the irreducible representations of $G(d e, 1, r)$, as in e.g. Ar, ArKo, MM].

We extract from Ma09a the following criterium. For $\mathfrak{h}$ a semisimple Lie algebra, we let rk $\mathfrak{h}$ denote its semisimple rank.

Lemma 3.2. Let $\mathfrak{h} \subset \mathfrak{g} \subset \mathfrak{s l}_{N}$ be semisimple Lie algebras with $\mathfrak{g}$ acting irreducibly on $\mathbb{k}^{N}$. If $\mathrm{rk} \mathfrak{h}>N / 2$, or if $\mathrm{rk} \mathfrak{h}=N / 2$ with $\mathbb{k}^{N}$ not selfdual as a $\mathfrak{g}$-module, then $\mathfrak{g}=\mathfrak{s l}_{N}$
Proof. If $\mathrm{rk} \mathfrak{g}>N / 2$ this is Ma09a lemma 3.1. If $\mathrm{rk} \mathfrak{g}=N / 2$, then by Ma09a lemma 3.3, since $N<(N / 2+1)^{2}$ for all $N$, we get that $\mathfrak{g}$ is simple. Then [Ma09a] lemma 3.4 shows that the only possibility is that $\mathfrak{g}=\mathfrak{s l}_{N}$.

Let $\rho \in \operatorname{Irr}(W) \backslash \Lambda \operatorname{Ref}$. If $\rho(t)=u \in \mathbb{k}^{\times}$, then $u=\zeta^{-k}$ for some $k$ and $\rho \otimes$ $\alpha^{k}(W)=\rho\left(W_{0}\right)$ so the result follows from Ma09a, as $\left(\rho \otimes \alpha^{k}\right)\left(\mathcal{H}_{s}^{\prime}\right)=\rho\left(\mathcal{H}_{0}^{\prime}\right)$. From now on we assume that $\rho(t) \notin \mathbb{k}^{\times}$, and we decompose $\operatorname{Res}_{W_{0}} \rho=$ $\rho_{1}+\cdots+\rho_{m}$ in irreducible components. By Clifford theory, $\rho_{i} \not \not \nsim \rho_{j}$ for $i \neq j$. We denote $\epsilon$ the sign character on $W_{0}$. Since the $\rho_{i}$ are deduced from each other through conjugation by $t$, the condition $\forall i \rho_{i} \notin \Lambda \operatorname{Ref}\left(W_{0}\right)$ is equivalent to $\rho_{1} \notin \Lambda \operatorname{Ref}\left(W_{0}\right)$. We note that we can choose an ordering on $\rho_{1}, \ldots, \rho_{m}$ such that $V_{\rho}=V_{\rho_{1}} \oplus \cdots \oplus V_{\rho_{m}}$ with $V_{\rho_{b+k}}=\rho\left(t^{k}\right) V_{\rho_{b}}$ and $\rho_{k+1} \simeq \rho_{k} \circ \operatorname{Ad}(t)$. A consequence is that $p=|\operatorname{Sp} \rho(t)| \geq m$. Recall that, if $p \geq 3$, then $\rho_{\mathcal{H}_{s}^{\prime}}$ is not selfdual. This is thus the case if $m \geq 3$.
3.1.1. The case $m=1, \rho_{1} \notin \Lambda$ Ref. If $\rho_{1} \nsucceq \rho_{1}^{*} \otimes \epsilon$, then by Ma09a we already have $\rho\left(\mathcal{H}_{s}^{\prime}\right)=\mathfrak{s l}\left(V_{\rho}\right)$, so we can assume $\rho_{1} \simeq \rho_{1}^{*} \otimes \epsilon$, and let $\mathfrak{h}=$ $\rho\left(\mathcal{H}_{0}^{\prime}\right)$. By Ma09a this is a simple Lie algebra $\mathfrak{o s p}_{0}\left(V_{\rho}\right)$ of $\operatorname{rank}(\operatorname{dim} \rho) / 2$ that preserves some nondegenerate bilinear form over $V_{\rho}$ and acts irreducibly on $V_{\rho}$.

If $\left(\rho_{\mathcal{H}^{\prime}}\right)^{*} \not 千 \rho_{\mathcal{H}^{\prime}}$ then by lemma 3.2 we get $\mathfrak{g}=\mathfrak{s l}\left(V_{\rho}\right)$, so we can assume that $\left(\rho_{\mathcal{H}^{\prime}}\right)^{*} \simeq \rho_{\mathcal{H}^{\prime}}$ (in particular, $\rho(t)$ admits exactly two eigenvalues $u, v$ ), hence $\mathfrak{g} \subset \mathfrak{o s p}\left(V_{\rho}\right)$. Since $\mathfrak{h}$ acts irreducibly on $V_{\rho}$, it can preserve only one such form (up to scalar), so from $\mathfrak{h} \subset \mathfrak{g} \subset \mathfrak{o s p}\left(V_{\rho}\right)$ and $\mathfrak{h} \subset \mathfrak{o s p}_{0}\left(V_{\rho}\right)$ we get $\mathfrak{o s p}\left(V_{\rho}\right)=\mathfrak{o s p}_{0}\left(V_{\rho}\right)$ and $\mathfrak{h}=\mathfrak{g}=\mathfrak{o s p}\left(V_{\rho}\right)$.
3.1.2. The case $m \geq 2, \rho_{1} \notin \Lambda \operatorname{Ref}, \rho_{\mathcal{H}_{s}^{\prime}} \not \not\left(\rho_{\mathcal{H}_{s}^{\prime}}\right)^{*}$. We need to show that $\mathfrak{g}=\mathfrak{s l}\left(V_{\rho}\right)$.

First assume $\rho_{1}^{*} \otimes \epsilon \simeq \rho_{1}$. Since $\rho_{1} \notin \Lambda$ Ref we have $\operatorname{dim} \rho_{1} \geq 3$ (see Ma09a] lemma 2.18) hence $\operatorname{dim} \rho \geq 6$. This implies $r \geq 3$, as it is easily
checked that the irreducible representations of $G(d e, e, 2)$ have dimension at most 2. It follows that $W_{0}$ has a single class of reflections. Since $W_{0} \neq H_{4}$, the $\rho_{i}$ then correspond to distinct ideals of $\operatorname{rank}\left(\operatorname{dim} \rho_{i}\right) / 2$ and $\mathfrak{g}$ contains a semisimple Lie algebra of rank $m(N / 2 m)=N / 2$. Then lemma 3.2 implies $\mathfrak{g}=\mathfrak{s l}\left(V_{\rho}\right)$.

Now assume $\rho_{1}^{*} \otimes \epsilon \not 千 \rho_{1}$. If $\forall i, j \quad \rho_{i} \not 千 \rho_{j}^{*} \otimes \epsilon$, then the rank of $\mathfrak{h}$ is $m(N / m-1)=N-m>N / 2$ iff $\operatorname{dim} \rho_{i}=N / m>2$, which holds true since $\rho_{i} \notin \Lambda$ Ref.

Otherwise, the map $\rho_{i} \mapsto \rho_{i}^{*} \otimes \epsilon$ induces a permutation of the $\rho_{i}$, as $\left(\rho_{1} \circ \operatorname{Ad}\left(t^{i}\right)\right)^{*} \otimes \epsilon=\left(\rho_{1}^{*} \otimes \epsilon\right) \circ \operatorname{Ad}\left(t^{i}\right)$, hence $m=2 q$ for some $q \geq 1$, and $\mathfrak{h}$ has rank $h=q(N / m-1)=N / 2-m / 2$. We have $N<(h+1)^{2}$ iff $N^{2}-2(m-4) N+(m-2)^{2}>0$. This trinomial in $N$ has for reduced discriminant $-2(2 m-6)<0$ for $m \geq 4$. Checking separately the case $m=2$, we get that $N<(h+1)^{2}$. It follows that $\mathfrak{g}$ is simple by Ma09a lemma 3.3 (I). Moreover, since $N / m=\operatorname{dim} \rho_{i}>2$ we have $h=N / 2-m / 2>N / 4$ hence $\operatorname{rkg}>N / 4$. Moreover $N=m \operatorname{dim} \rho_{1}$ with $\operatorname{dim} \rho_{1} \geq 3$ and $m \geq 2$ hence $N \geq 8$. Since $V_{\rho}$ is not selfdual as a $\mathfrak{g}$-module and $N \geq 8$ is even, by Ma09a lemma 3.4 we get that the only possibility for $\mathfrak{g} \neq \mathfrak{s l}_{N}$ implies $N=10$ and $\mathfrak{g} \simeq \mathfrak{s l}_{5}$, or $N=16$ and $\operatorname{rk} \mathfrak{g}=5$. The latter case is excluded, since it implies $\operatorname{dim} \rho_{i}=4, m=4$ and $\mathrm{rk} \mathfrak{g} \geq(N-m) / 2=6$; the former is excluded because then $\operatorname{dim} \rho_{i}=5$ and $\mathfrak{g} \simeq \mathfrak{s l}_{5} \simeq \rho\left(\mathcal{H}_{0}^{\prime}\right)$ implies $\mathfrak{g}=\rho\left(\mathcal{H}_{0}^{\prime}\right)$, which contradicts the fact that $\rho_{\mathfrak{g}}$ is irreducible whereas $\rho_{\mathcal{H}_{0}}^{\prime}$ is not. It follows that $\mathfrak{g}=\mathfrak{s l}\left(V_{\rho}\right)$ in this case.
3.1.3. The case $\rho_{1} \notin \Lambda \operatorname{Ref}, m \geq 2$ and $\rho_{\mathcal{H}_{s}^{\prime}} \simeq\left(\rho_{\mathcal{H}_{s}^{\prime}}\right)^{*}$. This implies $m=$ $2, p=2$. We have $\mathfrak{g} \subset \mathfrak{o s p}\left(V_{\rho}\right)$ and want to show $\mathfrak{g}=\mathfrak{o s p}\left(V_{\rho}\right)$.

By Clifford theory we have that $d=\# \alpha(W)$ even, so $d=2 q$, that $\rho \otimes \alpha^{q} \simeq$ $\rho$, and that $\rho_{1} \circ \operatorname{Ad}(t)=\rho_{2}$. Since $\alpha^{q}(t)=-1$, we get from $\alpha^{q} \otimes \rho \simeq \rho$ and $p=2$ that $\rho(t)$ has for eigenvalues $u,-u$ with the same multiplicities. Letting $u=\zeta^{-k}$ we get that $\rho^{\prime}=\rho \otimes \alpha^{k}$ has the same restriction to $W_{0}$ than $\rho$ with $\rho^{\prime}(t)^{2}=1$. Hence $\rho^{\prime}$ factorizes through the classical morphism $G(d e, e, r) \rightarrow G(d e, d e / 2, r)=W_{1}$ that preserves $\mathfrak{S}_{r}$ and maps $t$ to $t$. Since $W_{1}$ is a 2 -reflection group,
the conclusion that $\mathfrak{g}=\rho\left(\mathcal{H}_{s}^{\prime}\right)$ thus follows from Ma09a], as $\rho_{\mathcal{H}_{s}}$ is selfdual iff $\rho^{\prime} \simeq\left(\rho^{\prime}\right)^{*} \otimes \epsilon$ for $\epsilon$ the sign character of $W_{1}$, and $\rho \notin \Lambda \operatorname{Ref} \Rightarrow \rho^{\prime} \notin$ $\Lambda \operatorname{Ref}\left(W_{1}\right)$.
3.1.4. The case $\rho_{1} \in \Lambda \operatorname{Ref}\left(W_{0}\right)$. The list of representations in $\Lambda \operatorname{Ref}\left(W_{0}\right)$ can be found in Ma09a. We check on this list that the only possibilities for $\rho(t)$ not to be a scalar (in which case we would have $\rho \in \Lambda$ Ref) are the following two, with $\operatorname{dim} \rho=6$.

The former one is when $r=4, d e$ is even, $m=2, \rho_{1}$ has dimension 3 and, up to tensoring by some power of $\alpha, \rho$ is the restriction to $W$ of a representation $(\lambda, \emptyset, \ldots, \lambda, \emptyset, \ldots)$ of $G(d e, 1,4)$, with $\lambda \in\{[2],[1,1]\}$. But then $\rho(t)^{2}=1$ and $\mathfrak{g}$ coincides with the image of (the semisimple part of) the infinitesimal Hecke algebra of $G(d e, d e / 2,4)$, so the conclusion follows from Ma09a.

The latter is when $r=3, m=3, \operatorname{dim} \rho_{1}=2$ and, up to tensoring by some power of $\alpha, \rho$ is the restriction to $W$ of the representation
$([1], \emptyset, \ldots,[1], \emptyset, \ldots,[1], \emptyset, \ldots$,$) of G(d e, 1,3)$. It is easily checked (e.g. through the character table of $G(3,3,3))$ that $\rho_{i} \simeq \rho_{i}^{*} \otimes \epsilon$, hence the $\rho_{i}$ correspond to three distinct ideals of $\mathfrak{h}$ and $\mathfrak{h}$ has rank 3 . Then $\mathrm{rk} \mathfrak{h} \geq 6 / 2$, and $\rho_{\mathcal{H}_{s}^{\prime}}$ is not selfdual, as $m>2$ and by the argument in the previous section. By lemma 3.2 it follows that $\mathfrak{g}=\mathfrak{s l}\left(V_{\rho}\right)$, and this concludes the proof for the $G(d e, e, r)$.
3.1.5. Proof of lemma 2.9. We let $\rho \notin \Lambda \operatorname{Ref}$ with $\rho_{\mathcal{H}^{\prime}} \simeq\left(\rho_{\mathcal{H}^{\prime}}\right)^{*}$ and denote $\rho_{0}$ the restriction of $\rho$ to $W_{0}$. Assume first $\operatorname{dim} \rho=4$. If $\rho_{0}$ is irreducible, then $\rho_{0} \simeq \rho_{0}^{*} \otimes \epsilon$, where $\epsilon$ denotes the sign character of $W_{0}$. Then $\rho$ is of orthogonal type if and only if $\epsilon \hookrightarrow S^{2} \rho_{0}$, which is possible only for $W_{0}$ of type $F_{4}$ by Ma09a lemma 7.3. Since $W_{0}=G(d e, d e, r)$ is not of this type this excludes this case. If $\rho_{0}$ is not irreducible, then its irreducible components have dimension 2 or 1 , and in particular belong to $\Lambda \operatorname{Ref}\left(W_{0}\right)$. We saw above that this situation does not occur.

Now assume $\operatorname{dim} \rho=8$. As before, the irreducible components of $\rho_{0}$ do not belong to $\Lambda \operatorname{Ref}\left(W_{0}\right)$, and this excludes the case where $\rho_{0}$ admits 4 irreducible components. The case of $\rho_{0}$ irreducible (then $\epsilon \hookrightarrow S^{2} \rho_{0}$ ) is excluded by Ma09a] proposition 7.6. If $\rho_{0}$ admits 2 irreducible components $\rho_{1}, \rho_{2}$ of dimension 4 , then, since $\left(\rho_{0}\right)_{\mathcal{H}^{\prime}}$ would preserve a nondegenerate symmetric bilinear form, so would either $\left(\rho_{1}\right)_{\mathcal{H}_{0}^{\prime}}$ or $\left(\rho_{2}\right)_{\mathcal{H}_{0}^{\prime}}$. This is excluded by Ma09a lemma 7.3 , which concludes the case $\operatorname{dim} \rho=8$.

Finally, assume that $\operatorname{dim} \rho=6$. If $\rho_{0}$ is irreducible, we are done by Ma09a lemma 7.4. Otherwise, it admits either 2 or 3 irreducible components. The case of 3 irreducible components is excluded by $\left(\rho_{\mathcal{H}^{\prime}}\right)^{*} \simeq \rho_{\mathcal{H}^{\prime}}$, hence $\rho_{0}$ is the sum of 2 irreducible 3 -dimensional components. Then $d$ is even and, up to tensoring by some multiplicative character, $\rho$ corresponds to a multipartition of the form ([2], . . , [2], ...) that factorize through $W_{1}=G(d e, d e / 2, r)$. This situation is then dealt with again by Ma09a] lemma 7.4.

Now assume $\operatorname{dim} \rho=2 N+1>1$. Then $\rho$ is of symmetric type if $\rho\left(\mathcal{H}^{\prime}\right) \simeq$ $\mathfrak{s o}_{2 N+1}$. Let $\rho_{1}$ denote an irreducible component of $\rho_{0}$. We have $\operatorname{dim} \rho_{1}>1$, and also $\rho_{1}\left(W_{0}\right) \not \subset \mathbb{k}^{\times}$, otherwise $\rho(W)$ is abelian and $\operatorname{dim} \rho=1$. It follows that $W_{0}$ act by the sign character $\epsilon$ on this form, hence this form admits involutive skewisometries afforded by the 2-reflections in $W_{0}$. This implies that this form is hyperbolic (see Ma09a, lemma 2.5), hence $2 N+1$ is even, a contradiction that concludes the proof of lemma 2.9 for the general series.
3.2. Exceptional groups. Among the 34 exceptional groups in the ShephardTodd classification, 15 of them are 2-reflection groups, and were dealt with in Ma09a. The others mostly have rank 2, plus 3 groups of higher rank, namely $G_{25}, G_{26}$ and $G_{32}$.

For a given $\rho \in \operatorname{Irr}(W)$, given an explicit matrix model $\rho: W \rightarrow \operatorname{GL}\left(V_{\rho}\right)$, the dimension of $\rho\left(\mathcal{H}_{s}^{\prime}\right)$ can be computed by the following algorithm : start from the $\rho(s)$ for $s \in \mathcal{S}$, extract a basis for the spanned subspace in $\mathfrak{g l}\left(V_{\rho}\right)$, add to this subspace the images of this basis under the $\operatorname{ad}(\rho(s))$ for $s \in \mathcal{S}$, and then iterate the process until the dimension stops increasing ; this gives the dimension $d$ of $\rho\left(\mathcal{H}_{s}\right)$, and $\rho\left(\mathcal{H}_{s}^{\prime}\right)$ has dimension $d$ or $d-1$ if one of the $\rho(s)$ for $s \in \mathcal{S}$ has nonzero trace. Of course this dimension is the same for
$\rho$ and for $\rho \otimes \eta$ if $\eta \in \operatorname{Hom}\left(W, \mathbb{k}^{\times}\right)$, which reduces sometimes drastically (notably for $W$ of type $G_{19}$ ) the number of representations to check.

This algorithm is tractable provided that $\operatorname{dim} \rho$ is reasonably small, and that explicit matrix models are available. These two conditions are satisfied by all these exceptional groups, except for $G_{32}$.

For $W \neq G_{32}$, the irreducible representations have dimension at most 9 , explicit matrix models were computed by various authors, and are now included in the CHEVIE package for the GAP3 software, which is available at http://www.math.jussieu.fr/~jmichel/. We check using the above algorithm that $\operatorname{dim} \rho\left(\mathcal{H}_{s}^{\prime}\right)=\operatorname{dim}(\rho)^{2}-1$, that is $\rho\left(\mathcal{H}_{s}^{\prime}\right)=\mathfrak{s l}\left(V_{\rho}\right)$, for all $\rho \notin \Lambda \operatorname{Ref}$ (in particular this shows that $\rho_{\mathcal{H}^{\prime}} \nsim\left(\rho_{\mathcal{H}^{\prime}}\right)^{*}$ for all these representations). This proves lemmas 2.9 and 3.1 in these cases, and the structure theorem by lemma 2.10.

The only group $W$ remaining to be dealt with is $G_{32}$. In that case we use a parabolic subgroup $W_{0}$ of type $G_{25}$ and, assuming the theorem proved in type $G_{25}$, we consider, for each $\rho \in \operatorname{Irr}(W)$, the (reductive) Lie algebra generated by the $\rho(s), s \in \mathcal{S} \cap W_{0}$, and let $\mathfrak{h}(\rho)$ denote its semisimple part (that is, its intersection with $\mathfrak{s l}\left(V_{\rho}\right)$ ). By the analysis carried out above of the infinitesimal Hecke algebra of type $G_{25}$, we know to which simple Lie ideal corresponds each irreducible representation of $W_{0}$. It follows that the rank of $\mathfrak{h}$ can be deduced from the knowledge of the induction table from $W_{0}$ to $W$, which is known and included in CHEVIE. Using it, we get that $\mathfrak{h}(\rho)$ has rank greater than $\operatorname{dim} \rho / 2$ for all $\rho \notin \Lambda \operatorname{Ref}$, that is $\rho\left(\mathcal{H}_{s}^{\prime}\right)=\mathfrak{s l}\left(V_{\rho}\right)$ by lemma 3.2, This completes the proofs of lemmas 2.9 and 3.1, and of the structure theorem.

## 4. Generic Hecke algebras

We let $\mathcal{C}_{+}$denote the set of conjugacy classes $c$ of hyperplanes with $e_{c}>2$, and $\mathbb{A}(W)=\prod_{c \in \mathcal{C}_{+}} \mathbb{k}^{e_{C}-1}$. A typical element of $\mathbb{A}(W)$ is denoted $\underline{\boldsymbol{\lambda}}=$ $\left(\underline{\lambda}^{c}\right)_{c \in \mathcal{C}_{+}}$, with $\underline{\lambda}^{c}=\left(\lambda_{1}^{c}, \ldots, \lambda_{e_{c}-1}^{c}\right)$. We denote $\mathcal{S}_{+}=\left\{s \in \mathcal{S} \mid s^{2} \neq 1\right\}$, $\mathcal{S}_{0}=\left\{s \in \mathcal{S} \mid s^{2}=1\right\}$, and let $\mathcal{H}(\underline{\boldsymbol{\lambda}})$ denote the Lie subalgebra of $\mathbb{k} W$ generated by $\mathcal{S}_{0}$ and the $\lambda_{1}^{c} s+\cdots+\lambda_{e_{c}-1}^{c} s^{e_{c}-1}$ for $s \in \mathcal{S}_{+}$with reflecting hyperplane in $c \in \mathcal{C}_{+}$.
4.1. Preliminaries. Let $\zeta \in \mathbb{k}$ a primitive $n$-th root of 1 . Note that, if $n$ is the order of some pseudo-reflection of $W$, then $\mathbb{k}$ contains $\mu_{n}(\mathbb{C}$ ) (e.g. because the defining representation is realizable over $\mathbb{k}$ ).

In $\mathbb{k}^{n}$ we define $v_{i}=\left(1, \zeta^{i},\left(\zeta^{i}\right)^{2}, \ldots,\left(\zeta^{i}\right)^{n-1}\right)$ for $i \in[0, n-1]$. Since the corresponding (Vandermonde) determinant is invertible, these elements form a basis of $\mathbb{k}^{n}$. It follows that, for $(i, j) \neq(k, l)$ with $i \neq j$ or $k \neq l$, $H_{i, j, k, l}=\left\{\underline{\lambda} \in \mathbb{k}^{n}|<\underline{\lambda}| v_{i}-v_{j}-v_{k}+v_{l}>=0\right\}$ is an hyperplane of $\mathbb{k}^{n}$.

Proposition 4.1. Let $P \in A=\mathbb{k}[X] /\left(X^{n}-1\right)$ and $\zeta \in \mathbb{k}$ a primitive $n$-th root of 1. Then
(1) $P$ generates $A$ as a unital algebra if and only if, for all $r, s \in[0, n-1]$, $r \neq s \Rightarrow P\left(\zeta^{r}\right) \neq P\left(\zeta^{s}\right)$.
(2) the unital subalgebra of $A \otimes_{\mathbb{k}} A=\mathbb{k}[X, Y] /\left(X^{n}-1, Y^{n}-1\right)$ generated by $P(X)+P(Y)$ contains $X+Y$ if and only if, for all $i, j, k, l$, $\zeta^{i}+\zeta^{j} \neq \zeta^{k}+\zeta^{l} \Rightarrow P\left(\zeta^{i}\right)+P\left(\zeta^{j}\right) \neq P\left(\zeta^{k}\right)+P\left(\zeta^{l}\right)$.
(3) letting $P=P_{\underline{\lambda}}=\lambda_{0}+\lambda_{1} X+\cdots+\lambda_{n-1} X^{n-1}$, for $\underline{\lambda} \notin H_{i, j, k, l}$, $P\left(\zeta^{i}\right)-P\left(\zeta^{j}\right)=P\left(\zeta^{k}\right)-P\left(\zeta^{l}\right)$ implies $(i, j)=(k, l)$, or $i=j$ and $k=l$.

Proof. We consider $\pi_{i}: A \rightarrow \mathbb{k}[X] /\left(X-\zeta^{i}\right)=\mathbb{k}$ that maps $X$ to $\zeta^{i}$. Then $\pi=\bigoplus_{i=0}^{n-1} \pi_{i}: A \rightarrow \mathbb{k}^{n}$ is a ring isomorphism, and $\pi(P)$ generates $\mathbb{k}^{n}$ if and only if, by Lagrange interpolation, $\pi_{r}(P) \neq \pi_{s}(P) \neq 0$ whenever $r \neq s$. Then (1) follows. We then consider $\pi_{i, j}: A \otimes_{\mathbb{k}} A \rightarrow \mathbb{k}[X, Y] /\left(X-\zeta^{i}, Y-\zeta^{j}\right)=\mathbb{k}$ mapping $X \mapsto \zeta^{i}, Y \mapsto \zeta^{j}$ and $\pi=\bigoplus_{i, j}: A \otimes_{\mathbb{k}} A \simeq \mathbb{k}^{n^{2}}$. Once again by Lagrange interpolation we get (2). Then (3) follows from the identification $P=\lambda_{0}+\lambda_{1} X+\cdots+\lambda^{n-1} X \mapsto \underline{\lambda}$ of $A$ with $\mathbb{k}^{n}$, for which $P\left(\zeta^{i}\right)=<\underline{\lambda} \mid v_{i}>$.

We will also need the following lemma
Lemma 4.2. Let $\mathfrak{g} \subset \mathfrak{s l}(V)$ be a complex semisimple Lie algebra acting irreducibly on $V$, and $\rho: \mathfrak{g} \rightarrow \mathfrak{s l}(V)$ the defining representation such that $\rho^{\otimes 2}$ admits at most 3 irreducible components. Then $\mathfrak{g}$ is a simple Lie algebra. Moreover, if $\rho^{\otimes 2}$ admits two irreducible components, then $\mathfrak{g}=\mathfrak{s l}(V)$; if $\rho^{\otimes 2}$ admits three irreducible components and $\rho^{*} \simeq \rho$, then $\mathfrak{g}$ preserves some nondegenerate bilinear form, and $\mathfrak{g}=\mathfrak{o s p}\left(V_{\rho}\right)$ w.r.t. this form.
Proof. If $\mathfrak{g}=\mathfrak{g}_{1} \times \mathfrak{g}_{2}$ with the $\mathfrak{g}_{i}$ nontrivial semisimple Lie algebras, then $V=V_{1} \otimes V_{2}$ with $V_{i}$ an irreducible representation of $\mathfrak{g}_{i}$. But then $\rho^{\otimes 2}=$ $V_{1}^{\otimes 2}+V_{1} \otimes V_{2}+V_{2} \otimes V_{1}+V_{2}^{\otimes 2}$ would admit at least 4 irreducible components. It follows that $\mathfrak{g}$ is simple. The conclusion follows from Ma01 prop. 1.
4.2. Generic infinitesimal Hecke algebras. For $c \in \mathcal{C}_{+}$we choose a primitive $e_{c}$-root $\zeta_{c}$ of 1 , and we denote $v_{i}^{c} \in \mathbb{k}^{e_{c}-1}$ the vector $\zeta_{c}^{i},\left(\zeta_{c}^{i}\right)^{2}, \ldots,\left(\zeta_{c}^{i}\right)^{e_{c}-1}$. Identifying $\mathbb{A}(W)$ with $\mathbb{k}^{\sum_{c \in \mathcal{C}_{+}}}{ }^{\left(e_{c}-1\right)}$ we denote $<\cdot \mid \cdot>$ the natural scalar product on $\mathbb{A}(W)$. We introduce in $\mathbb{A}(W)$ the following hyperplane arrangements

$$
\begin{aligned}
& \mathcal{L}_{1}=\left\{\operatorname{Ker}<v_{r}^{c}-v_{s}^{c}|\cdot>| r \neq s, c \in \mathcal{C}_{+}\right\} \\
& \mathcal{L}_{2}=\left\{\operatorname{Ker}<v_{i}^{c}+v_{j}^{c}-v_{k}^{c}-v_{l}^{c}|\cdot>| \zeta_{c}^{i}+\zeta_{c}^{j} \neq \zeta_{c}^{k}+\zeta_{c}^{l}, c \in \mathcal{C}_{+}\right\} \\
& \mathcal{L}_{3}=\left\{\operatorname{Ker}<v_{i}^{c}-v_{j}^{c}-v_{k}^{c}+v_{l}^{c}|\cdot>|(i, j) \neq(k, l) \text { and }(i \neq j \text { or } k \neq l), c \in \mathcal{C}_{+}\right\}
\end{aligned}
$$

Note that these three sets do not depend on the choice of the primitive $e_{c^{-}}$ roots $\zeta_{c}$. Also note that $\mathcal{L}_{1} \subset \mathcal{L}_{2} \cap \mathcal{L}_{3}$. For $\rho \in \operatorname{Irr}(W)$, we let $\rho_{\mathcal{H}(\underline{\boldsymbol{\lambda}})}, \rho_{\mathcal{H}(\underline{\boldsymbol{\lambda}})^{\prime}}$ the representations of $\mathcal{H}(\underline{\boldsymbol{\lambda}}), \mathcal{H}(\underline{\boldsymbol{\lambda}})^{\prime}$ respectively, that are induced by $\rho$. We let $\mathbb{A}^{\times}(W)=\mathbb{A}(W) \backslash \bigcup\left(\mathcal{L}_{1} \cup \mathcal{L}_{2} \cup \mathcal{L}_{3}\right)=\backslash \bigcup\left(\mathcal{L}_{2} \cup \mathcal{L}_{3}\right)$.

Let $c$ be a conjugacy class in $W$. We let $p: \mathbb{k} W \rightarrow Z(\mathbb{k} W)$ denote the natural projection $p(g)=(1 /|W|) \sum_{h \in g} h g h^{-1}$.

Let $c$ be a conjugacy class of reflections in $\mathcal{S}$. We denote $\mathcal{S} / W$ the set of such classes. For $c \in \mathcal{S}_{0}$ we denote $T_{c}(\underline{\boldsymbol{\lambda}})=T_{c}=\sum_{s \in c} s \in Z(\mathbb{k} W)$ and for $c \in \mathcal{S}_{+}$we let

$$
T_{c}(\underline{\boldsymbol{\lambda}})=\sum_{s \in c} \sum_{i=1}^{e_{c}-1} \lambda_{i}^{c} s^{i}=\sum_{i=1}^{e_{c}-1} \lambda_{i}^{c} \sum_{s \in c} s^{i} \in Z(\mathbb{k} W)
$$

For $s \in \mathcal{S}_{0}$ we let $s(\underline{\boldsymbol{\lambda}})=s$ and for $s \in \mathcal{S}_{+}$we let $s(\underline{\boldsymbol{\lambda}})=\sum_{i=1}^{e_{c}-1} \lambda_{i} s^{i}$. Clearly $T_{c}(\underline{\boldsymbol{\lambda}})=p(s(\underline{\boldsymbol{\lambda}}))|c|$ for any $s \in c \subset \mathcal{S}$.

Proposition 4.3. For every value of $\underline{\boldsymbol{\lambda}}$, the Lie algebra $\mathcal{H}(\underline{\boldsymbol{\lambda}})$ is reductive.
Proof. We consider the direct sum of all the irreducible representations of $W$. This provides a faithful representation of $\mathcal{H}(\underline{\boldsymbol{\lambda}})$. In order to prove that $\mathcal{H}(\underline{\boldsymbol{\lambda}})$ is reductive it is sufficient to prove that this representation is semisimple which means that, for every $\rho \in \operatorname{Irr}(W)$, the representation of the envelopping Lie algebra $\mathbf{U \mathcal { H }}(\underline{\boldsymbol{\lambda}})$ induced by $\rho$ is semisimple. Up to extending scalars we can assume $\mathbb{k}=\mathbb{C}$, and then assume that $\rho(W)$ preserves some unitary form over $\operatorname{End}\left(V_{\rho}\right)$. Then the elements $x=\lambda_{1}^{c} s+\cdots+\lambda_{e_{c}-1}^{c} s^{e_{c}-1}$ act by normal operator (i.e. endomorphisms commuting with their adjoints), which means that $\rho(x)$ is a polynomial of its adjoint. In particular, if $U \subset V_{\rho}$ is stable under $\rho(\mathbf{U \mathcal { H }}(\underline{\boldsymbol{\lambda}}))$, then its orthogonal is stable under each of the elements $\rho(x)$, hence under $\rho(\mathbf{U \mathcal { H }}(\underline{\boldsymbol{\lambda}}))$. As a consequence $V_{\rho}$ is completely reducible and the conclusion follows.

Proposition 4.4. (1) For each $\rho \in \operatorname{Irr}(W), \rho_{\mathcal{H}(\underline{\boldsymbol{\lambda}})}$ and $\rho_{\mathcal{H}(\underline{\boldsymbol{\lambda}})^{\prime}}$ are irreducible as soon as $\boldsymbol{\lambda} \notin \bigcup \mathcal{L}_{1}$.
(2) If $\underline{\boldsymbol{\lambda}} \notin \bigcup \mathcal{L}_{1}$, the center of $\mathcal{H}(\underline{\boldsymbol{\lambda}})$ has dimension $|\mathcal{S} / W|$, is spanned by the $T_{c}(\underline{\boldsymbol{\lambda}})$ for $c \in \mathcal{S} / W$ and $\mathcal{H}(\underline{\boldsymbol{\lambda}})^{\prime}$ is generated by the $s(\underline{\boldsymbol{\lambda}})-T_{c}(\underline{\boldsymbol{\lambda}}) /|c|$.
(3) Let $\rho \in$ QRef or $\rho \notin \Lambda \operatorname{Ref}$, and $\underline{\boldsymbol{\lambda}} \notin \bigcup\left(\mathcal{L}_{1} \cup \mathcal{L}_{2}\right)$. Then $\rho\left(\mathcal{H}(\underline{\boldsymbol{\lambda}})^{\prime}\right)=$ $\rho\left(\mathcal{H}^{\prime}\right)$.
(4) For $\underline{\boldsymbol{\lambda}} \in \mathbb{A}(W)^{\times}, \mathcal{H}(\underline{\boldsymbol{\lambda}})^{\prime}=\mathcal{H}^{\prime}$.

Proof. (1) For each $s \in \mathcal{S}_{+}$with reflection hyperplane $H \in c \in \mathcal{C}_{+}, \rho(s)$ is a polynomial in $\sum \lambda_{i}^{c} s^{i}$ by the lemma if $\underline{\boldsymbol{\lambda}} \notin \bigcup \mathcal{L}_{1}$. This implies that the algebra generated by $\rho(\mathcal{H}(\underline{\boldsymbol{\lambda}}))$ and $\rho\left(\mathcal{H}_{s}\right)$ are the same, hence $\rho_{\mathcal{H}(\underline{\boldsymbol{\lambda}})}$ is irreducible. and $\rho(\mathcal{H}(\underline{\boldsymbol{\lambda}}))$ is reductive. This implies that $\rho\left(\mathcal{H}(\underline{\boldsymbol{\lambda}})^{\prime}\right)=$ $\rho(\mathcal{H}(\underline{\boldsymbol{\lambda}}))^{\prime}$ is semisimple and that $\rho_{\mathcal{H}(\underline{\boldsymbol{\lambda}})^{\prime}}$ is irreducible. (2) Since, under this conditition, $\mathcal{H}(\underline{\boldsymbol{\lambda}})$ generates $\mathbb{k} W$ as a unital algebra, we have $Z(\mathcal{H}(\underline{\boldsymbol{\lambda}})) \subset$ $Z(\mathbb{k} W)$. Since $\mathcal{H}(\underline{\boldsymbol{\lambda}})$ is reductive we have $\mathcal{H}(\underline{\boldsymbol{\lambda}})=Z(\mathcal{H}(\underline{\boldsymbol{\lambda}})) \oplus \mathcal{H}(\underline{\boldsymbol{\lambda}})^{\prime}$ hence $p(\mathcal{H}(\underline{\boldsymbol{\lambda}}))=p(Z(\mathcal{H}(\underline{\boldsymbol{\lambda}})))=Z(\mathcal{H}(\underline{\boldsymbol{\lambda}}))$. Let $E \subset \mathbb{k} W$ be the subspace spanned by the generators of $\mathcal{H}(\underline{\boldsymbol{\lambda}})$ and, for a conjugacy class $c$, denote $\delta_{c}$ the linear form on $\mathbb{k} W$ defined by $\delta_{c}(g)=1$ if $g \in c, \delta_{c}(g)=0$ otherwise. We have $\left(\mathbb{k}_{k} W\right)^{\prime}=\cap_{c} \operatorname{Ker} \delta_{c}=\operatorname{Ker} p$. Since $\mathcal{H}(\underline{\boldsymbol{\lambda}})$ is generated by $E$ we have $\mathcal{H}(\underline{\boldsymbol{\lambda}})=E+\mathcal{H}(\underline{\boldsymbol{\lambda}})^{\prime}$ hence $p(\mathcal{H}(\underline{\boldsymbol{\lambda}}))=p(E)$, hence $Z(\mathcal{H}(\underline{\boldsymbol{\lambda}}))$ is spanned by the $T_{c}(\underline{\boldsymbol{\lambda}})$ for $c \subset \mathcal{S}$. Finally, the $s(\underline{\boldsymbol{\lambda}})-p(s(\underline{\boldsymbol{\lambda}}))$ generate a Lie algebra containing $\mathcal{H}(\underline{\boldsymbol{\lambda}})^{\prime}$, as $p(s(\underline{\boldsymbol{\lambda}})) \in Z(\mathcal{H}(\underline{\boldsymbol{\lambda}}))$ and contained in $\mathcal{H}(\underline{\boldsymbol{\lambda}}) \cap \operatorname{Ker} p=\mathcal{H}(\underline{\boldsymbol{\lambda}})^{\prime}$, which concludes the proof of (2). We now prove (3). For such a $\rho$, we let $\tilde{\rho}$ denote the representation $\rho_{\mathcal{H}_{s}^{\prime}} \otimes \rho_{\mathcal{H}_{s}^{\prime}}$ extended to the envelopping algebra $\mathrm{UH}_{s}^{\prime}$. First assume that $\rho\left(\mathcal{H}^{\prime}\right)=\rho\left(\mathcal{H}_{s}^{\prime}\right)=\mathfrak{s l}\left(V_{\rho}\right)$. Then $\tilde{\rho}\left(\mathrm{U} \mathcal{H}_{s}^{\prime}\right) \simeq$ $\operatorname{End}\left(S^{2} V_{\rho}\right) \oplus \operatorname{End}\left(\Lambda^{2} V_{\rho}\right)$. Since $\underline{\boldsymbol{\lambda}} \notin \bigcup \mathcal{L}_{2}$ we get by the lemma that, for each $s \in \mathcal{S}_{+}$with reflection hyperplane $H \in c \in \mathcal{C}_{+}, \rho(s)$ is a polynomial in $\tilde{\rho}\left(\sum \lambda_{i}^{c} s^{i}\right)$. Then $\tilde{\rho}\left(\mathrm{UH}(\underline{\boldsymbol{\lambda}})^{\prime}\right)=\tilde{\rho}\left(\mathrm{U} \mathcal{H}_{s}^{\prime}\right)=\operatorname{End}\left(S^{2} V_{\rho}\right) \oplus \operatorname{End}\left(\Lambda^{2} V_{\rho}\right)$. In particular, $\rho_{\mathcal{H}(\underline{\boldsymbol{\lambda}})^{\prime}} \otimes \rho_{\mathcal{H}(\underline{\boldsymbol{\lambda}})^{\prime}}$ admits two irreducible components, hence $\rho\left(\mathcal{H}(\underline{\boldsymbol{\lambda}})^{\prime}\right)=$ $\mathfrak{s l}\left(V_{\rho}\right)=\rho\left(\mathcal{H}^{\prime}\right)$ by lemma 4.2, Now assume that $\rho\left(\mathcal{H}^{\prime}\right)=\rho\left(\mathcal{H}_{s}^{\prime}\right)=\mathfrak{o s p}\left(V_{\rho}\right)$. By the same argument, $\rho_{\mathcal{H}(\underline{\boldsymbol{\lambda}})^{\prime}} \otimes \rho_{\mathcal{H}(\underline{\boldsymbol{\lambda}})^{\prime}}$ admits three irreducible components and $\rho_{\mathcal{H}^{\prime}} \simeq\left(\rho_{\mathcal{H}^{\prime}}\right)^{*} \Rightarrow \rho_{\mathcal{H}_{s}^{\prime}} \simeq\left(\rho_{\mathcal{H}_{s}^{\prime}}\right)^{*}$, hence $\rho\left(\mathcal{H}(\underline{\boldsymbol{\lambda}})^{\prime}\right)=\mathfrak{o s p}^{\prime}\left(V_{\rho}\right)$ for some nondegenerate bilinear form by lemma 4.2. On the other hand, $\rho\left(\mathcal{H}(\underline{\boldsymbol{\lambda}})^{\prime}\right) \subset$ $\rho\left(\mathcal{H}^{\prime}\right)=\mathfrak{o s p}\left(V_{\rho}\right)$, hence $\mathfrak{o s p}^{\prime}\left(V_{\rho}\right) \subset \mathfrak{o s p}\left(V_{\rho}\right)$ which implies $\mathfrak{o s p}^{\prime}\left(V_{\rho}\right)=\mathfrak{o s p}\left(V_{\rho}\right)$ and proves (3). Let $s \in \mathcal{S}$ and $\rho^{1}, \rho^{2} \in \operatorname{Irr}(W)$ with $\rho_{\mathcal{H}(\underline{\boldsymbol{\lambda}})^{\prime}}^{1} \simeq \rho_{\mathcal{H}(\underline{\boldsymbol{\lambda}})^{\prime}}^{2}$.

Identifying $V_{\rho^{1}}=V_{\rho^{2}}=V$, there exists $Q \in \mathrm{GL}(V)$ and $\omega_{s} \in \mathbb{k}$ with $Q P_{\underline{\lambda}^{c}}\left(\rho^{2}(s)\right) Q^{-1}=P_{\underline{\lambda}^{c}}\left(\rho^{1}(s)\right)+\omega_{s}$ if $s \in \mathcal{S}_{+}$, and $Q \rho^{2}(s) Q^{-1}=\rho^{1}(s)+\omega_{s}$ otherwise. If $\rho^{1}(s) \notin \mathbb{k}^{\times}$, for $s^{2}=1$ this implies $\omega_{s}=0$ as in the proof of prop. 2.6 ; otherwise, $\rho^{1}(s)$ admits at least two eigenvalues $\zeta_{c}^{i} \neq \zeta_{c}^{j}$. Then $P\left(\zeta_{c}^{i}\right)-\omega_{s}=P\left(\zeta_{c}^{k}\right)$ and $P\left(\zeta_{c}^{j}\right)-\omega_{s}=P\left(\zeta_{c}^{l}\right)$ for some $k, l$ hence $P\left(\zeta_{c}^{i}\right)-P\left(\zeta_{c}^{k}\right)-P\left(\zeta_{c}^{j}\right)+P\left(\zeta_{c}^{l}\right)=0$. If $\omega_{s} \neq 0$ we have $i \neq k$ and $j \neq l$. Since $i \neq j$ we get a contradiction for $\underline{\boldsymbol{\lambda}} \in \mathbb{A}(W)^{\times}$, thus $\omega_{s}=0$. We thus get $\rho^{2}=\rho^{1} \otimes \eta$ for some $\eta \in \mathrm{X}\left(\rho^{1}\right)$ and $\rho_{\mathcal{H}^{\prime}}^{1} \simeq \rho_{\mathcal{H}^{\prime}}^{2}$. We now assume $\left.\left(\rho_{\mathcal{H}(\underline{\boldsymbol{\lambda}}}\right)^{\prime}\right)^{*} \simeq \rho_{\mathcal{H}(\boldsymbol{\lambda})^{\prime}}^{2}$. For $s \in \mathcal{S}$ with reflection hyperplane in $c \in \mathcal{C}_{+}$, the equation $Q P_{\lambda^{c}}\left(\rho^{2}(s)\right) Q^{-1}=-{ }^{t} P\left(\rho^{1}(s)\right)+\omega_{s}$ with $\rho^{1}(s) \notin \mathbb{k}^{\times}$with eigenvalues $\zeta_{c}^{i} \neq \zeta_{c}^{j}$, implies that there exists $\zeta_{c}^{k} \neq \zeta_{c}^{i}, \zeta_{c}^{l} \neq \zeta_{c}^{i}$ with $-P\left(\zeta_{c}^{i}\right)+\omega_{s}=P\left(\zeta_{c}^{k}\right)$, $-P\left(\zeta_{c}^{j}\right)+\omega_{s}=P\left(\zeta_{c}^{l}\right)$ whence $P\left(\zeta_{c}^{i}\right)-P\left(\zeta_{c}^{j}\right)+P\left(\zeta_{c}^{k}\right)-P\left(\zeta_{c}^{l}\right)=0$. Since $\zeta_{c}^{i} \neq \zeta_{c}^{j}$ and $\zeta_{c}^{k} \neq \zeta_{c}^{l}$, we get from $\underline{\boldsymbol{\lambda}} \in \mathbb{A}(W)^{\times}$that $\left(\zeta_{c}^{i}, \zeta_{c}^{j}\right)=\left(\zeta_{c}^{k}, \zeta_{c}^{l}\right)$. But then $\omega_{s}=2 P\left(\zeta_{c}^{i}\right)=2 P\left(\zeta_{c}^{j}\right)$ which implies $\zeta_{c}^{i}=\zeta_{c}^{j}$, a contradiction. We conclude as above that $\rho_{\mathcal{H}^{\prime}}^{2} \simeq\left(\rho_{\mathcal{H}}^{1}\right)^{*}$, and lemma 2.10 implies that $\mathcal{H}(\underline{\boldsymbol{\lambda}})^{\prime}=\mathcal{H}^{\prime}$, as $\mathcal{H}^{\prime}=\mathcal{M}$ by theorem 2.8.

Note that, if $\underline{\boldsymbol{\lambda}}, \underline{\boldsymbol{\mu}} \in \mathbb{A}(W)$ are such that, for all $c \in \mathcal{S}_{+} / W$, we have $\underline{\mu}^{c}=$ $u_{c} \underline{\lambda}^{c}$ for some $u_{c} \in \overline{\mathbb{k}}^{\times}$, clearly $\mathcal{H}(\underline{\boldsymbol{\lambda}})=\mathcal{H}(\underline{\boldsymbol{\mu}})$. Now denote $\alpha_{c} \in \operatorname{Hom}\left(W, \mathbb{k}^{\times}\right)$ defined by $\alpha_{c}(s)=\zeta_{c}$ for $s \in c \subset \mathcal{S}$, and $\bar{\alpha}_{c}(s)=1$ for $s \in \mathcal{S} \backslash c$. Any tuple $\underline{n}=\left(n_{c}\right)_{c \in \mathcal{S} / W}$ of integers with $0 \leq n_{c}<e_{c}-1$ then defines a character $\alpha_{\underline{n}}=\prod_{c \in \mathcal{S} / W} \alpha_{c}^{n_{c}}$ and we can define $\Phi_{\underline{n}} \in \operatorname{Aut}(\mathbb{k} W)$ by $\Phi_{\underline{n}}(g)=\alpha_{\underline{n}}(g) g$ for $g \in W$. For any $\rho \in \operatorname{Irr}(W)$ we have $\rho \circ \Phi_{\underline{n}} \simeq \alpha_{\underline{n}} \otimes \rho$ and, for any $\underline{\boldsymbol{\lambda}} \in \mathbb{A}(W)$ we have $\Phi_{\underline{n}}(\mathcal{H}(\underline{\boldsymbol{\lambda}}))=\mathcal{H}(\underline{\boldsymbol{\mu}})$ with $\mu_{i}^{c}=\zeta_{c}^{i n_{c}} \lambda_{i}^{c}$ for each $c, i$. The hyperplane arrangements $\mathcal{L}_{i}$ are clearly invariant under these operations.

## 5. Applications to Zariski closures

We recall that $W<\operatorname{GL}(V)$ is a finite group generated by a set $\mathcal{R}$ of (pseudo-)reflections that defines an hyperplane complement $\mathcal{A}=\{\operatorname{Ker}(s-$ 1) $\mid s \in \mathcal{R}\}=\{\operatorname{Ker}(s-1) \mid s \in \mathcal{S}\}$. The (generalized) pure braid group and braid group associated to them are $P=\pi_{1}(X)$ and $B=\pi_{1}(X / W)$, where $X$ is the hyperplane complement $V \backslash \cup \mathcal{A}$ and a base point in $X$ (hence in $X / W)$ is chosen once and for all.

We refer to [BMR] to the basic properties of these groups, only updating some terminology and recalling a few basic facts.

The composition of paths $(\alpha, \beta) \mapsto \alpha \beta$ is given by following first $\beta$ and then $\alpha$. With this convention, the Galois covering $X \rightarrow X / W$ defines a natural morphism $B \rightarrow W$ with kernel $P$. We call the generators-of-themonodromy in $B$ which were associated to elements of $\mathcal{R}$ in BMR braided reflections. Recall from BMR that they generate $B$.

An important structure associated to the hyperplane complement $X$ is its holonomy Lie algebra $\mathcal{T}$ (see e.g. K0]). It is generated by one element $t_{H}$ for each hyperplane $H \in \mathcal{A}$, and there is a natural action of $W$ by automorphisms of $\mathcal{T}$, given by $w . t_{H}=t_{w(H)}$. To each $H \in \mathcal{A}$ is associated a (well-defined) logarithmic 1-form $\omega_{H}=\mathrm{d} \alpha_{H} / \alpha_{H}$, for an arbitrary 1-form $\alpha_{H} \in V^{*}$ with kernel $H$.

To any representation $\varphi: \mathcal{T} \rightarrow \mathfrak{g l}_{N}(\mathbb{C})$ is associated a (family of) integrable 1-form(s)

$$
\omega=h \sum_{H \in \mathcal{A}} \varphi\left(t_{H}\right) \omega_{H}
$$

over $X$ with values in $\mathfrak{g l}_{N}(\mathbb{C})$, depending on some complex parameter $h$. By monodromy this family of 1-forms defines a family of representations of $P=\pi_{1}(X)$, that can be considered as a representation $P \rightarrow \mathrm{GL}_{N}(A)$ with $A=\mathbb{C}[[h]] \subset K=\mathbb{C}((h))$.

If $\mathbb{C}^{N}=V_{\rho}$ for some linear representation $\rho$ of $W$ such that $\varphi: \mathcal{T} \rightarrow \mathfrak{g l}\left(V_{\rho}\right)$ is equivariant w.r.t. the natural actions of $W$, then the representation of $P$ naturally extends to a representation $B \rightarrow \mathrm{GL}\left(V_{\rho} \otimes A\right)$. A change of basepoint gives rise to a representation which is isomorphic to the former one.

In BMR is introduced a representation of $\mathcal{T}$, depending on a collection $\tau_{c, j}$ of complex numbers for $c \in \mathcal{A} / W=\mathcal{S} / W$, where $\mathcal{S}$ here denotes the set of distinguished reflections, and $0 \leq j \leq e_{c}-1$. For $H \in c$ and $s_{H} \in \mathcal{S}$ with $\operatorname{Ker}(s-1)=H$, it is given by
$\varphi\left(t_{H}\right)=\sum_{j=0}^{j=e_{c}-1} \tau_{H, j} \frac{1}{e_{c}} \sum_{k=0}^{k=e_{c}-1} \zeta_{c}^{-j k} \rho\left(s_{H}^{k}\right)=\sum_{k=0}^{e_{c}-1} \frac{1}{e_{c}}\left(\sum_{j=0}^{j=e_{c}-1}\left(\zeta_{c}^{-k}\right)^{j} \tau_{H, j}\right) \rho\left(s_{H}\right)^{k}$ with $\zeta_{c}=\operatorname{det}\left(s_{H}\right)=\exp \left(2 \mathrm{i} \pi / e_{c}\right)$. The representation of $B$ associated to that satisfies

$$
\prod_{j=0}^{e_{c}-1}\left(\sigma-q_{H, j} \zeta_{c}^{j}\right)=0
$$

for any braided reflection associated to $s_{H}$ and $q_{H, j}=\exp \left(-h \tau_{H, j} / e_{c}\right)$, and deforms $\rho$ into a representation of the Hecke algebra of $W$, as defined in [BMR, with these parameters.

We note that the specialization of interest in the Broué-Malle-Michel 'Spetses' program (see [BMM]) is for $q_{H, 0}=q$ and $q_{H, j}=1$ for $j \neq 0$. This specialization corresponds to the choice of parameters $\tau_{H, j}=0$ for $j \neq 0$.

We let $R: P \rightarrow \mathrm{GL}\left(V_{\rho} \otimes K\right)$ denote the representation of $P$ associated to $\rho$. We refer to Ma07b for a proof of the next proposition.

Proposition 5.1. For any representation $\rho$ of $W$, the Lie algebra of the Zariski closure of $R(P)$ contains $\varphi(\mathcal{T}) \otimes K$. If $\varphi(\mathcal{T})$ preserves some bilinear form over $V_{\rho}$, then $R(P)$ preserves the induced bilinear form over $V_{\rho} \otimes K$.

The group $P$ is generated by the $\sigma^{e_{c}}$ for $\sigma$ running among the braided reflections, with $c$ denoting the class of the hyperplane attached to $\sigma$. We have
$\operatorname{det} R\left(\sigma^{e_{c}}\right)=\exp \left(h e_{c} \operatorname{tr} \varphi\left(t_{H}\right)\right)=\exp \left(h \sum_{k=0}^{e_{c}-1}\left(\sum_{j=0}^{j=e_{c}-1}\left(\zeta_{c}^{-k}\right)^{j} \tau_{H, j}\right) \operatorname{tr} \rho\left(s_{H}\right)^{k}\right)$
We let $\lambda_{k}^{c}=\sum_{j=0}^{j=e_{c}-1}\left(\zeta_{c}^{-k}\right)^{j} \tau_{c, j}$. Note that this defines a bijection between the $\left(\lambda_{k}^{c}\right)$ and the $\left(\tau_{c, k}\right)$ by invertibility of the Vandermonde determinant. With this notation, $\varphi\left(t_{H}\right)=\left(1 / e_{c}\right) \sum_{k=0}^{e_{c}-1} \lambda_{k}^{c} \rho\left(s_{H}\right)^{k}$.

Also note that $\lambda_{0}^{c}=\sum_{j=0}^{e_{c}-1} \tau_{c, j}$. Up to tensoring $R$ by the 1 -dimensional representation that maps a braided reflexion around $H \in \mathcal{A}$ of class $c$ to $\exp \left(h\left(\sum_{j=0}^{e_{c}-1} \tau_{c, j}\right) / e_{c}\right)$, we can assume $\lambda_{0}^{c}=0$, which we do from now on.

With this convention, we have $\varphi(\mathcal{T})=\rho(\mathcal{H}(\underline{\boldsymbol{\lambda}}))$, hence $\varphi(\mathcal{T})$ is a reductive Lie algebra. From proposition 5.1 and theorem 2.8 one readily gets the following.

Theorem 5.2. If $\underline{\boldsymbol{\lambda}} \in \mathbb{A}(W)^{\times}$then $\varphi(\mathcal{T})$ is reductive, $\varphi(\mathcal{T})^{\prime}=\rho\left(\mathcal{H}^{\prime}\right)$ and $R(P)$ has connected Zariski closure, with Lie algebra $\rho(\mathcal{H}(\underline{\boldsymbol{\lambda}}))$.

## 6. Unitarizability questions

The determination of the Zariski closure is specially useful when the representations involved are unitarizable. The monodromy construction as described above provides a morphism $B \rightarrow W \ltimes \exp \widehat{\mathcal{T}}$, where $\mathcal{T}$ is completed with respect to the graduation $\operatorname{deg} t_{H}=1$.

Recall from [K0] that $\mathcal{T}$ can be defined over an arbitrary field $\mathbb{k}$ of characteristic 0 . We state the following conjecture :

Conjecture 1. For an arbitrary complex (pseudo-)reflection group $W$ and field $\mathfrak{k}$ of characteristic 0, there exists morphisms $\Phi: B \rightarrow W \ltimes \exp \mathcal{T}$, with $\mathcal{T}$ defined over $\mathfrak{k}$, such that $\Phi(\sigma)$ is conjugated to $s_{H} \exp t_{H}$ by some element in $\exp \widehat{\mathcal{T}}$ for every braided reflection $\sigma$ associated to $s_{H}$ and $H \in \mathcal{A}$.

Evidences for this conjecture include the fact that it holds for $W=\mathfrak{S}_{n}$ by using a rational associator as defined by Drinfeld (see [Dr]), for $W$ of type $G(d, 1, n)$ by using the analogous gadgets by Enriquez ([En]; see also the appendix of Ma06), and for $W$ of type $G(e, e, 2)$ (see Ma06). Another evidence is that all the varieties involved are defined over $\mathbb{Q}$, as proved in (MM].

Recall that it is conjectured in BMR that the Hecke algebra of $W$ is always a flat deformation of the group algebra of $W$. In the sequel, we call this the BMR-conjecture. It is known to hold for all but possibly a finite number of exceptional cases.

Notice that a necessary condition for the representation $R$ defined in a previous section to be unitary is that the $q_{H, j} \zeta_{c}^{j}$ have modulus 1 . When $h$ is specialized to a purely imaginary number, this happens exactly when the $\tau_{H, j}$ are real numbers, for $0 \leq j \leq e_{c}-1$. Since, for $e_{c}-1 \geq k \geq 1$,

$$
\lambda_{k}^{c}-\overline{\lambda_{e_{c}-k}^{c}}=\sum_{j=1}^{e_{c}-1}\left(\zeta_{c}^{-k}\right)^{j}\left(\tau_{c, j}-\overline{\tau_{c, j}}\right)
$$

this imposes that $\lambda_{k}^{c}$ is the complex conjugate of $\lambda_{e_{c}-k}^{c}$.
Theorem 6.1. If conjecture 1 and the BMR-conjecture hold for $W$ when $\mathbb{k}=\mathbb{R}$ and, for all $c \in \mathcal{C}_{+}$and $0 \leq j \leq e_{c}-1, \tau_{c, j} \in \mathbb{R}$, then $R$ is unitarizable for $h \in \operatorname{iR}$ small enough.

Proof. Up to tensoring the representation by a 1-dimensional unitary one, we can assume that $\lambda_{0}^{c}=0$ for every $c \in \mathcal{C}^{+}$. The condition then exactly means that, for all $1 \leq k \leq e_{c}-1, \lambda_{k}^{c}$ is the complex conjugate of $\lambda_{e_{c}-k}^{c}$.

We introduce the following automorphisms of $K=\mathbb{C}((h))$. Let $\epsilon \in$ $\operatorname{Aut}(K)$ being defined through $f(h) \mapsto f(-h)$, and $\bar{\epsilon}$ be the its composed by the complex conjugation $\sum_{r \geq r_{0}} a_{r} h^{r} \mapsto \sum_{r \geq r_{0}} \overline{a_{r}}(-h)^{r}$. We can assume $\rho(W) \subset U_{N}$. We let $U_{N}^{\bar{\epsilon}}(K)=\left\{\left.x \in \mathrm{GL}_{N}(K)\right|^{\bar{t}} \bar{\epsilon}(x)=x^{-1}\right\}$. Since $\varphi\left(t_{H}\right)=$ $\left(1 / e_{c}\right) \sum_{k=0}^{e_{c}-1} \lambda_{k}^{c} \rho\left(s_{H}\right)^{k}$ and since the $\rho\left(s_{H}\right)^{k}$ are unitary, our assumption implies that $\varphi\left(t_{H}\right)$ is selfadjoint, hence $\exp h \varphi\left(t_{H}\right) \in U_{N}^{\bar{\epsilon}}(K)$. Let $\sigma$ be a braided reflection corresponding to $s_{H}$, and $\tilde{\varphi}: \widehat{\mathcal{T}} \rightarrow \mathfrak{g l}_{N}(K)$ be defined through $t_{H} \mapsto h \varphi\left(t_{H}\right)$. Now consider the automorphism $A \in \operatorname{Aut}\left(\mathfrak{g l}_{N}(K)\right)$ given by $x \mapsto-{ }^{t} x$. We have $A \circ \tilde{\varphi}\left(t_{H}\right)={ }^{t} h \varphi\left(t_{H}\right)=-h \overline{\varphi\left(t_{H}\right)}=\bar{\epsilon} \circ \tilde{\varphi}\left(t_{H}\right)$. It follows that $A \circ \tilde{\varphi}=\bar{\epsilon} \circ \tilde{\varphi}$ and in particular $-{ }^{t} \tilde{\varphi}(\psi)=A \circ \tilde{\varphi}(\psi)=\bar{\epsilon} \circ \tilde{\varphi}(\psi)=$ $\bar{\epsilon}(\tilde{\varphi}(\psi))$. Taking exponentials, we get

$$
\left({ }^{t} \exp (\tilde{\varphi}(\psi))\right)^{-1}=\exp \left(-^{t} \tilde{\varphi}(\psi)\right)=\exp (\bar{\epsilon}(\tilde{\varphi}(\psi)))=\bar{\epsilon}(\exp ((\tilde{\varphi}(\psi)))
$$

whence $\exp \tilde{\varphi}(\psi) \in U_{N}^{\bar{\epsilon}}(K)$. Finally note that $\rho\left(s_{H}\right) \in U_{N} \subset U_{N}^{\bar{\epsilon}}(K)$. Now $(\rho, \tilde{\varphi})$ provide a morphism $W \ltimes \exp \widehat{\mathcal{T}} \rightarrow \mathrm{GL}_{N}(K)$. Combining it with $\Phi$ we thus get a representation $R^{\prime}: B \rightarrow U_{N}^{\bar{\epsilon}}(K)$, that factorizes through the Hecke algebra. Under the BMR-conjecture, we have $R \simeq R^{\prime}$, since both $R$ and $R^{\prime}$ specialize to $\rho$ through $h=0$.

Let $L$ be a subfield of $K$ containing $\mathbb{R}$, the entries of the $R^{\prime}(b)$ for $b \in B$ as well as i $\in \mathbb{C}$ and $h$. Since $B$ is finitely generated we can take for $L$ a finitely generated extension of $\mathbb{R}(h)$. Up to considering $L+\epsilon(L)$ we can assume $\epsilon(L)=L$. Since i $\in L$ we have $L=L_{0} \oplus \mathrm{i} L_{0}$ with $L_{0} \in \mathbb{R}((h))$ and $\epsilon\left(L_{0}\right)=L_{0}$. By Ma09b proposition 3.1 we know that $L_{0}$ is isomorphic to some finitely generated extension $L_{0}^{*}$ of $\mathbb{R}(h)$ inside the field of convergent Laurent series $\mathbb{R}(\{h\})$, through a $\epsilon$-equivariant isomorphism. It extends to $\bar{\epsilon}$-equivariant isomorphism between $L=L_{0}+\mathrm{i} L_{0}$ and $L^{*}=L_{0}^{*}+\mathrm{i} L_{0}^{*}$. Since $R^{\prime}(B) \subset U_{N}^{\bar{\epsilon}}(L) \simeq U_{N}^{\bar{\epsilon}}\left(L^{*}\right)$ we get a new representation $R^{\prime \prime}: B \rightarrow$ $U_{N}^{\bar{\epsilon}}(\mathbb{C}(\{h\}))$. The isomorphism $L_{0} \rightarrow L_{0}^{*}$ can be chosen such that the entries of the $R(b)$, for $b$ running inside a finite set of generators for $B$, are unchanged modulo $h$. By the same argument as above, under the BMR-conjecture, $R^{\prime \prime}$ is isomorphic to $R^{\prime}$ hence to $R$ over $\mathbb{C}((h))$. Since $R^{\prime \prime}$ and $R$ are both defined over $\mathbb{C}(\{h\})$, they are conjugated over this field. Since they coincide modulo $h$ they are both defined over the ring of convergent power series, so their specialisations to small $h$ are isomorphic over $\mathbb{C}$. Now, for $h \in \mathbb{i}$ small enough, the specialization of $R^{\prime \prime}$ is unitary, and this concludes the proof.
Corollary 6.2. If $W$ is a complex reflection group of type $G(d e, e, r)$, then $R$ is unitarizable under the above conditions on the parameters.
Proof. The BMR-conjecture is known to hold for $W$ of these types. Since conjecture $\square$ holds for $W$ of type $G(d e, 1, r)$ by En, we get unitarity for these groups. Now the Hecke algebra of type $G(d e, e, r)$ is a subalgebra of the one of type $G(d e, 1, r)$, with images of braided reflexions mapped to images of braided reflections (see $[\mathbf{R R}$ ); since any irreducible representation of the Hecke algebra of type $G(d e, e, r)$ appears in the restriction of one of type $G(d e, 1, r)$ (see $[\mathrm{RR}$ ), this concludes the proof of the corollary.

We recall from Ma09a that the unitarizability is known for Coxeter groups, and was also proved for the reflection representation by geometric methods in CHL.

In the unitary cases, and for transcendant values of the parameters, the Lie algebra of the topological closure is then given by a compact form of the Lie algebra of the Zariski closure. Such a compact form is described by the following generalization of Ma09a prop. 2.27.

Proposition 6.3. Assume that, for all $c \in \mathcal{C}_{+}$and $1 \leq k \leq e_{c}-1$, $\lambda_{k}^{c}$ is the complex conjugate of $\lambda_{e_{c}-k}^{c}$. Then the real Lie subalgebra $\mathcal{H}_{c}(\underline{\boldsymbol{\lambda}})$ of $\mathbb{C} W$ generated by the $\mathrm{i} s, s \in \mathcal{S}_{0}$ and the $\mathrm{i}\left(\sum \lambda_{k}^{c} s^{k}\right)$ for $s \in c \subset \mathcal{S}_{+}$is a compact real Lie subalgebra of $\mathcal{H}(\underline{\boldsymbol{\lambda}})$. Moreover, $\mathcal{H}_{c}(\underline{\boldsymbol{\lambda}})^{\prime}$ is a compact real form of $\mathcal{H}(\underline{\boldsymbol{\lambda}})^{\prime}$.

Proof. We define on $\mathbb{C} W$ a sesquilinear form by $\left(w_{1}, w_{2}\right)=\delta_{w_{1}, w_{2}}$ for $w_{1}, w_{2} \in$ $W$. This form is clearly positive definite. By left action we have $\mathcal{H}(\underline{\boldsymbol{\lambda}}) \subset$ $\mathbb{C} W \subset \operatorname{End}(\mathbb{C} W)$, and the generators of $\mathcal{H}_{c}(\underline{\boldsymbol{\lambda}})$ are easily checked to satisfy, under our assumption, the equality $x^{*}=-x$, where $x^{*}$ denotes the adjoint of $x \in \operatorname{End}(\mathbb{C} W)$ with respect to our form. This proves that $\mathcal{H}_{c}(\underline{\boldsymbol{\lambda}})$ is a real Lie subalgebra of the compact Lie algebra $\mathfrak{u}(\mathbb{C} W)$, and therefore is a compact Lie algebra. Now $\mathcal{H}_{c}(\underline{\boldsymbol{\lambda}})^{\prime}+\mathrm{i} \mathcal{H}_{c}(\underline{\boldsymbol{\lambda}})$ is a complex Lie subalgebra of $\mathcal{H}(\underline{\boldsymbol{\lambda}})^{\prime}$, which equals $\mathcal{H}\left(\underline{\boldsymbol{\lambda}}^{\prime}\right)$ because every iterated bracket $\left[x_{1},\left[x_{2}, \ldots,\left[x_{r-1}, x_{r}\right] \ldots\right]\right.$ in the defining generators of $\mathcal{H}(\underline{\boldsymbol{\lambda}})$ can be written as $(-\mathrm{i})^{r}\left[y_{1},\left[y_{2}, \ldots,\left[y_{r-1}, y_{r}\right] \ldots\right]\right.$ where the $y_{k}=\mathrm{i} x_{k}$ are the defining generators of $\mathcal{H}_{c}(\underline{\boldsymbol{\lambda}})$. Since $\mathcal{H}_{c}(\underline{\boldsymbol{\lambda}})^{\prime}$ is a compact Lie subalgebra of the semisimple Lie algebra $\mathcal{H}(\underline{\boldsymbol{\lambda}})^{\prime}$, its real dimension is at most $\operatorname{dim}_{\mathbb{C}} \mathcal{H}(\underline{\boldsymbol{\lambda}})^{\prime}=\left(\operatorname{dim}_{\mathbb{R}} \mathcal{H}(\underline{\boldsymbol{\lambda}})^{\prime}\right) / 2$ (otherwise it would define a compact subgroup of the semisimple group $\exp \mathcal{H}(\underline{\boldsymbol{\lambda}})^{\prime}$, of real dimension larger than its maximal compact subgroups). It follows that $\mathcal{H}_{c}(\underline{\boldsymbol{\lambda}})^{\prime} \cap \mathrm{i} \mathcal{H}_{c}(\underline{\boldsymbol{\lambda}})^{\prime}=\{0\}$ hence $\mathcal{H}_{c}(\underline{\boldsymbol{\lambda}})^{\prime}$ is a compact real form of $\mathcal{H}(\underline{\boldsymbol{\lambda}})^{\prime}$.

## 7. Special situations

7.1. The special Hecke algebra. Let $W$ an irreducible reflection group, and $\rho^{1}, \rho^{2} \in \operatorname{Irr}(W)$. We assume that $\rho_{\mathcal{H}_{s}^{\prime}}^{1} \simeq \rho_{\mathcal{H}_{s}^{\prime}}^{2}$. We can assume that $\rho^{2}(s)=\rho^{1}(s)+\omega_{s}$ for all $s \in \mathcal{S}$. Note that $\omega_{s} \in \mathbb{k}$ only depends on the conjugacy class of $\mathcal{S}$. If $\mathcal{X}=\operatorname{Sp} \rho^{1}(s)$ we have $\mathcal{X}+\omega_{s}=\operatorname{Sp} \rho^{2}(s) \subset \mu_{n}$, where $n$ is the order of $s$. By lemma 2.5 we have $\omega_{s} \neq 0 \Rightarrow\left|\operatorname{Sp}\left(\rho^{2}(s)\right)\right| \leq 2$. Up to tensoring $\rho^{1}$ by some character in $\mathrm{X}\left(\rho^{1}\right)$, we can assume that, for all $s \in \mathcal{S}$, either $\rho^{2}(s)=\rho^{1}(s)$, or $\left|\operatorname{Sp}\left(\rho^{2}(s)\right)\right|=2$ when $\omega_{s} \neq 0$. When $\operatorname{Sp}\left(\rho^{2}(s)\right)=\{\alpha, \beta\}$ with $\alpha \neq \beta$, then $\omega_{s}=\alpha+\beta$ and $\operatorname{Sp} \rho^{1}(s)=\{-\alpha,-\beta\}$. This is only possible for $n$ an even integer. Also note that, if $n=2$, then necessarily $\omega_{s}=0$. We can thus assume that $n>2$ and $n$ is even.

Since $\rho^{1}(s)$ is semisimple, $\rho^{1}\left(s^{-1}\right)=\left(-\alpha^{-1} \beta^{-1}\right)\left(\rho^{1}(s)+\omega_{s}\right)$, hence there exists $\chi \in \operatorname{Hom}\left(W, \mathbb{k}^{\times}\right)$defined by $\chi(s)=1$ if $\omega_{s}=0$ and $\chi(s)=(-1 / \alpha \beta)$ when $\omega_{s} \neq 0$ and $\operatorname{Sp} \rho^{1}(s)=\{\alpha, \beta\}$ with $\alpha \neq \beta$, such that $\rho^{3}=\rho^{2} \otimes \chi$ is an irreducible representation of $W$ that satisfies $\rho^{3}(s)=\rho^{1}\left(s^{-1}\right)$ for all $s \in \mathcal{S}$ with $\omega_{s} \neq 0$ and $\rho^{3}(s)=\rho^{1}(s)$ when $\omega_{s}=0$.

Using the Shephard-Todd classification we can check on the representations of the exceptional groups that these situations do not occur for $W$ an exceptional group. The first remark is that the orders of the pseudoreflections for such a group are at most 5 , so the only cases to consider are when $W$ admits a pseudo-reflection of order 4 . There are four such groups,
namely $G_{8}, G_{9}, G_{10}$ and $G_{11}$. In these four cases, there are six pseudoreflections of order 4 , and only one class of such pseudo-reflections in $\mathcal{S}$. We then restrict to the $\rho^{1} \in \operatorname{Irr}(W)$ such that the formulas $s \mapsto \rho^{1}\left(s^{-1}\right)$ if $s \in \mathcal{S}$ has order 4 and $s \mapsto \rho^{1}(s)$ otherwise define a representation of $W$. All such representations have dimensions 1 or 2 . Then the representation $\rho^{2}$ is given by $\rho^{2}(s)=-\left(\operatorname{det} \rho^{1}(s)\right) \rho^{1}\left(s^{-1}\right)$ when $s \in \mathcal{S}$ has order 4 and $\rho^{2}(s)=\rho^{1}(s)$ otherwise, and it is readily checked that $\rho^{2}$ has the same character as $\rho^{1}$ in all cases. This proves the following.

Proposition 7.1. Let $W$ be an exceptional irreducible reflection group. For $\rho^{1}, \rho^{2} \in \operatorname{Irr}(W), \rho_{\mathcal{H}_{s}^{\prime}}^{1} \simeq \rho_{\mathcal{H}_{s}^{\prime}}^{2}$ if and only if $\rho_{\mathcal{H}^{\prime}}^{1} \simeq \rho_{\mathcal{H}^{\prime}}^{2}$, that is $\rho^{2}=\rho^{1} \otimes \eta$ for some $\eta \in \mathrm{X}\left(\rho^{1}\right)$.

We now consider $W=G(d e, e, r)$, for which we can assume with $d>2$. The elements in $\mathcal{S}$ of order more than 2 have order $d$ and form a single conjugacy class $c \subset \mathcal{S}$. We can thus assume $d$ even, and let $\zeta=\zeta_{c}$. The elements of $c$ are then the $t_{i}=\operatorname{diag}(1, \ldots, 1, \zeta, 1, \ldots, 1)$ for $1 \leq i \leq r$. Is is easily checked (see e.g. $[\mathbf{M M}]$ ) that the formulas $t_{i} \mapsto t_{i}^{-1}$ define (uniquely) an automorphism $\mathfrak{c}$ of $W$ that fixes $\mathfrak{S}_{r} \subset W$.

It follows that $\rho_{\mathcal{H}_{s}^{\prime}}^{2} \simeq \rho_{\mathcal{H}_{s}^{\prime}}^{1}$ if and only if either $\rho_{\mathcal{H}^{\prime}}^{2} \simeq \rho_{\mathcal{H}^{\prime}}^{1}$ or $\rho^{1}\left(t_{1}\right)$ has two eigenvalues $\alpha \neq \beta$ and, up to tensoring by some character in $\mathrm{X}\left(\rho^{1}\right)$, $\rho^{2}=\chi \otimes \rho^{1} \circ \mathfrak{c}$, where $\chi \in \operatorname{Hom}\left(W, \mathbb{k}^{\times}\right)$is defined by $\chi\left(t_{i}\right)=-\alpha \beta, \chi(s)=1$ for $s \notin c$.

Proposition 7.2. Let $W=G(d e, e, r)$ with $d>2$ and $\rho^{1}, \rho^{2} \in \operatorname{Irr}(W)$. If $d$ is odd or $\operatorname{Sp}\left(\rho^{1}\left(t_{1}\right)\right) \neq 2$ then $\rho_{\mathcal{H}_{s}^{\prime}}^{1} \simeq \rho_{\mathcal{H}_{s}^{\prime}}^{2}$ iff $\rho_{\mathcal{H}^{\prime}}^{1} \simeq \rho_{\mathcal{H}^{\prime}}^{2}$.

The following is then a consequence of lemma 2.10.
Corollary 7.3. For $G(d e, e, r)$ with $d$ an odd integer, or $W$ an exceptional group, $\mathcal{H}_{s}^{\prime}=\mathcal{H}^{\prime}$.

We consider the special case $e=1$, and $\rho^{1}, \rho^{2}$ with $\rho_{\mathcal{H}^{\prime}}^{1} \nsucceq \rho_{\mathcal{H}^{\prime}}^{2}$ but $\rho_{\mathcal{H}_{s}^{\prime}}^{1} \simeq \rho_{\mathcal{H}_{s}^{\prime}}^{2}$. By the arguments above $d>2$ is even, and $\rho^{1}(t)$ admits two eigenvalues. This means that $\rho^{1}$ is labelled by a multipartition $\left(a_{0}, \ldots, a_{d-1}\right)$ with two non-empty parts $a_{i}, a_{j}$ with $i \neq j$, and $\operatorname{Sp} \rho^{1}\left(t_{1}\right)=\left\{\zeta^{a_{i}}, \zeta^{a_{j}}\right\}$ with $\zeta=\exp (2 \mathrm{i} \pi / d)$. Then $\rho^{3}=\rho^{1} \circ \mathfrak{c}$ corresponds to the multipartition $\left(b_{0}, b_{1}, \ldots, b_{d-1}\right)=\left(a_{0}, a_{d-1}, a_{d-2}, \ldots, a_{2}, a_{1}\right)$, and tensoring by $\chi$ with $\chi\left(t_{1}\right)=-a_{i} a_{j}=\zeta^{k}$ with $\zeta^{k}=-\zeta^{i+j}=\zeta^{d / 2+i+j}$, e.g. $k=d / 2+i+j$, leads to $\rho^{2}=\rho^{3} \otimes \chi$ labelled by $\left(b_{0-k}, b_{1-k}, \ldots, b_{d-2-k}, b_{d-1-k}\right)$. For instance, if $d=4, r=3$ and $\rho^{1}$ is labelled by ([2], $\left.[1], \emptyset, \emptyset\right)$, we have $\mathrm{X}\left(\rho^{1}\right)=\{\mathbb{1}\}$ and the only possibility is for $\rho^{2}$ labelled by $(\emptyset, \emptyset,[1],[2])$. More generally, if $\rho^{1}$ is the defining representation of $W$, labelled by $([r-1],[1], \emptyset)$, then $\mathrm{X}\left(\rho^{1}\right)=\{\mathbb{1}\}$, but $\rho_{\mathcal{H}_{s}^{\prime}}^{1} \simeq \rho_{\mathcal{H}_{s}^{\prime}}^{2}$ with $\rho^{1} \nsucceq \rho^{2}$ as the formulas above guarantee, for $d>2$ and $r \geq 3$, that the first part of (the multipartition labelling) $\rho^{2}$ will not be $[r-1]$.

For $e>1$, this example also provides $\rho^{1}, \rho^{2}$ with $\rho_{\mathcal{H}^{\prime}}^{1} \nsim \rho_{\mathcal{H}^{\prime}}^{2}$ but $\rho_{\mathcal{H}_{s}^{\prime}}^{1} \simeq \rho_{\mathcal{H}_{s}^{\prime}}^{2}$. As a consequence, we get that the above corollary is sharp.

Proposition 7.4. If $d>2$ is even and $r \geq 3$, then $\mathcal{H}_{s}^{\prime} \not \not \mathcal{H}^{\prime}$.
7.2. Cubic Hecke algebras. We assume that, for all $s \in \mathcal{S}, s^{3}=1$, and that there exists a single class $c$ of reflecting hyperplanes for $W$. For irreducible reflection group of rank at least 2, this happens exactly for the exceptional types $G_{4}, G_{25}, G_{32}$. In that case we have two parameters $\lambda_{1}, \lambda_{2}, \mathbb{A}(W)=\left\{\left(\lambda_{1}, \lambda_{2}\right) \in \mathbb{k}^{2}\right\}$ and $\mathcal{H}\left(\lambda_{1}, \lambda_{2}\right)$ is generated by the $\lambda_{1} s+\lambda_{2} s^{2}$ for $s \in \mathcal{S}$. Leting $j=\zeta_{c}=\exp (2 \mathrm{i} \pi / 3)$, we have $v_{0}=(1,1)$, $v_{1}=\left(j, j^{2}\right), v_{2}=\left(j^{2}, j\right)$. It is easily checked that we have here $\mathcal{L}_{3} \subset \mathcal{L}_{2}$ hence $\mathbb{A}(W)^{\times}=\mathbb{A}(W) \backslash \bigcup \mathcal{L}_{2}$. We have

$$
\begin{aligned}
\mathcal{L}_{1}= & \left\{\text { Ker }<v_{0}-v_{1} \mid \cdot>, \text { Ker }<v_{0}-v_{2} \mid \cdot>, \text { Ker }<v_{1}-v_{2} \mid \cdot>\right\} \\
\mathcal{L}_{2}= & \mathcal{L}_{1} \sqcup\left\{\operatorname{Ker}<v_{0}+v_{1}-2 v_{2} \mid \cdot>, \text { Ker }<v_{0}+v_{2}-2 v_{1} \mid \cdot>\right. \\
& \text { Ker } \left.<v_{1}+v_{2}-2 v_{0} \mid \cdot>\right\}
\end{aligned}
$$

It is clear that $\mathcal{H}(0,0)=\{0\}$, and we know $\mathcal{H}(0,1) \simeq \mathcal{H}(1,0)=\mathcal{H}_{s}$, which has already been studied (moreover $(1,0)$ and $(0,1)$ clearly belong to $\left.\mathbb{A}(W)^{\times}\right)$, so we can assume $\lambda_{1} \lambda_{2} \neq 0$. Then $\mathcal{H}\left(\lambda_{1}, \lambda_{2}\right)=\lambda_{1} \mathcal{H}\left(1, \lambda_{2} / \lambda_{1}\right)$, so we can assume $\lambda_{1}=1$ and $\lambda_{2}=a \in \mathbb{k}^{\times}$and let $\mathcal{H}(a)=\mathcal{H}(1, a)$. A straightforward computation shows $(1, a) \in \bigcup \mathcal{L}_{1}$ iff $a \in \mu_{3}$, and $(1, a) \in$ $\bigcup \mathcal{L}_{2}$ iff $a \in \mu_{3} \cup\left(-\mu_{3}\right)$. In particular $(1, a) \in \mathbb{A}(W)^{\times}$iff $a \notin \mu_{6}$.

For $a^{6} \neq 1$ (and $a \neq 0$ ), we have $\mathcal{H}(\underline{\lambda})^{\prime}=\mathcal{H}^{\prime}$. Letting $\Phi \in \operatorname{Aut}(\mathbb{k} W)$ denote as above the automorphism $s \mapsto j s$ for $s \in \mathcal{S}$, we have $\Phi(\mathcal{H}(a))=$ $\mathcal{H}\left(j, j^{2} a\right)=j \mathcal{H}(1, j a)=\mathcal{H}(1, j a)=\mathcal{H}(j a)$, so there are only two cases to consider, $a=1$ for $a \in \mu_{3}$, and $a=-1$ for $a \in-\mu_{3}$.

If $W=G_{4}$, there are three representations in $\overline{\text { QRef }}=$ QRef $=\Lambda \operatorname{Ref}$ of dimension 2, three 1-dimensional characters and a 3-dimensional one that we denote $\rho_{3}$. The 2-dimensional ones are the restrictions to a parabolic subgroup of type $G_{4}$ of the representations $U_{\alpha, \beta}$ of $G_{25}$. In order to avoid confusion, we denote them $U_{\gamma}$ for $\{\alpha, \beta, \gamma\}=\mu_{3}(\mathbb{C})$. The 3-dimensional one is the restriction $\bar{V}$ of $V \in \operatorname{Irr}\left(G_{25}\right)$. We assume that $\mathcal{S}$ is given by the distinguished pseudo-reflections.

We have $\mathcal{H}^{\prime}=\mathfrak{s l}\left(U_{1}\right) \times \mathfrak{s l}\left(U_{j}\right) \times \mathfrak{s l}\left(U_{j^{2}}\right) \times \mathfrak{s l}(\bar{V}) \simeq\left(\mathfrak{s l}_{2}\right)^{3} \times \mathfrak{s l}_{3}$. For $a=1$, we get by computer that $\operatorname{dim} \mathcal{H}(1)=15, \operatorname{dim} \mathcal{H}(1)^{\prime}=14, \operatorname{dim} Z(\mathcal{H}(1))=1$, and that the image in each irreducible representation of $W$ of $\mathcal{H}(1)^{\prime}$ is the same as $\mathcal{H}^{\prime}$, except for $U_{1}$, where the image is 0 . Since $\mathcal{H}(1)^{\prime}$ is semisimple this implies $\mathcal{H}(1)^{\prime}=\mathfrak{s l}\left(U_{j}\right) \times \mathfrak{s l}\left(U_{j^{2}}\right) \times \mathfrak{s l}(\bar{V}) \simeq \mathfrak{s l}_{2}^{2} \times \mathfrak{s l}_{3}$. Moreover, the center of $\mathcal{H}(1)$, having dimension 1 , is also spanned by $T_{\mathcal{S}}(1)=\sum_{s \in \mathcal{S}} s+s^{2}$ in this case. Another argument for this last fact, that will be used for $G_{25}$, is to notice that the image of $\mathcal{H}(1)$ in $U_{1}$ is $\mathbb{C}$ (more precisely, $s+s^{2}$ acts by -1). It follows that $Z(\mathcal{H}(1)) \subset Z(\mathcal{H}) \subset Z(\mathbb{C} W)$. Since $\mathcal{H}(1)$ is reductive and $\mathcal{H}(1)^{\prime} \subset$ Ker $p$, we thus recover $Z(\mathcal{H}(1))=p(\mathcal{H}(1))=\mathbb{C} T_{\mathcal{S}}(1)$.

For $a=-1$, we get by computer $\operatorname{dim} \mathcal{H}(-1)^{\prime}=6$, and the image in each of the irreducible representations of $W$ of $\mathcal{H}(-1)^{\prime}$ is the same as $\mathcal{H}^{\prime}$, except for $\bar{V}$, for which the image is of dimension 3 . Moreover, since $a \notin \mu_{3}, \mathcal{H}(-1)^{\prime}$ is semisimple. We check that the image of $\mathcal{H}(-1)^{\prime}$ in $\mathfrak{s l}\left(U_{j}\right) \times \mathfrak{s l}\left(U_{j^{2}}\right) \times \mathfrak{s l}(\bar{V})$ has dimension 3, hence $\mathcal{H}(-1)^{\prime} \simeq \mathfrak{s l}\left(U_{1}\right) \times \mathfrak{s l}_{2} \simeq\left(\mathfrak{s l}_{2}\right)^{2}$, the restriction of the three representations $U_{j}, U_{j^{2}}, \bar{V}$ to $\mathcal{H}(\underline{\lambda})^{\prime}$ factorizing through the same ideal $\mathfrak{s l}_{2}$. More previsely, we can identify $\mathcal{H}(-1)^{\prime}$ with $\mathfrak{s l}\left(A_{1}\right) \times \mathfrak{s l}\left(A_{2}\right)$ with $A_{1}, A_{2}$ two vector spaces with $\operatorname{dim} A_{i}=2$, such that the representations of $\mathcal{H}(-1)^{\prime}$
corresponding to $U_{1}, U_{j}, U_{j^{2}}, \bar{V}$ are $A_{1}, A_{2}, A_{2}, S^{2} A_{2}$, as $\mathfrak{s l}_{2}$ admits only one irreducible representation in each dimension.

We now consider $W=G_{25}$. For $a=1$, we get $\rho\left(\mathcal{H}(1)^{\prime}\right)=\rho\left(\mathcal{H}^{\prime}\right)$ for each $\rho \in \operatorname{Irr}(W)$ except $U_{j, j^{2}}$ and $U_{j^{2}, j}^{\prime}, U_{j, j^{2}}^{\prime}$ (recall that $U_{j, j^{2}}^{\prime} \approx U_{j^{2}, j}^{\prime}$ ), in which case $\rho\left(\mathcal{H}(1)^{\prime}\right)=\{0\}$. Moreover, we check that $\rho(\mathcal{H}(1))=\mathbb{C}$, and more precisely $\rho\left(s+s^{2}\right)=-1$ in these latter cases. We check by computer that, for any $\rho^{1}, \rho^{2}$ not in these exceptional cases and $\rho^{1} \not \approx \rho^{2}$, then $\left(\rho^{1} \oplus \rho^{2}\right)\left(\mathcal{H}(1)^{\prime}\right)$ has dimension $\operatorname{dim} \rho^{1}\left(\mathcal{H}(1)^{\prime}\right)+\operatorname{dim} \rho^{2}\left(\mathcal{H}(1)^{\prime}\right)$, hence $\left(\rho^{1} \oplus \rho^{2}\right)\left(\mathcal{H}(1)^{\prime}\right)=\rho^{1}\left(\mathcal{H}(1)^{\prime}\right) \oplus \rho^{2}\left(\mathcal{H}(1)^{\prime}\right)$. This proves that the simple ideals determined by the non-exceptional $\rho \in \operatorname{Irr}(W)$ (up to $\approx$ ) never coincide, hence $\mathcal{H}(1)^{\prime} \simeq \mathfrak{s l}_{2}^{2} \times \mathfrak{s l}_{3}^{3} \times \mathfrak{s l}_{6}^{6} \times \mathfrak{s l}_{8}^{3} \times \mathfrak{s l}_{9}^{2}$ is the kernel of the representation $U_{j, j^{2}} \oplus U_{j^{2}, j}^{\prime}$ restricted to $\mathcal{H}^{\prime}$. We get that $Z(\mathcal{H}(1))=\mathbb{C} T_{\mathcal{S}}(1,1)$ by the same argument as above.

The situation for $\mathcal{H}(-1)$ is a lot messier. As before, computing the dimensions of $\rho\left(\mathcal{H}(-1)^{\prime}\right)$ determines the type of the corresponding ideals (notice that $\mathfrak{s l}_{2}, \mathfrak{s l}_{3}, \mathfrak{s l}_{2} \times \mathfrak{s l}_{3}$ are the only semisimple algebras of dimensions 3,8, and 11 respectively) ; computing the dimensions of the $\left(\rho^{1} \oplus \rho^{2}\right)\left(\mathcal{H}(-1)^{\prime}\right)$ determines the simple ideals of $\mathcal{H}(-1)$. We get that

$$
\begin{aligned}
\mathcal{H}(-1) & =\mathfrak{s l}\left(A_{1}\right) \times \mathfrak{s l}\left(A_{2}\right) \times \mathfrak{s l}^{( }\left(B_{1}\right) \times \mathfrak{s l}\left(B_{2}\right) \times \mathfrak{s l}(C) \times \mathfrak{s l}(D) \times \mathfrak{s l}(E) \\
& \simeq \mathfrak{s l}_{2}^{2} \times \mathfrak{s l}_{3}^{2} \times \mathfrak{s l}_{6} \times \mathfrak{s l}_{8} \times \mathfrak{s l}_{9}
\end{aligned}
$$

with $\operatorname{dim} A_{i}=2, \operatorname{dim} B_{i}=3, \operatorname{dim} C=6, \operatorname{dim} D=8$ and $\operatorname{dim} E=9$. Under this identification, the isomorphism type of the representations $\rho_{\mathcal{H}(-1)^{\prime}}$ is then determined using $\operatorname{dim} \rho$, the dimension of the invariants in $\rho_{\mathcal{H}(-1)^{\prime}}^{1} \otimes$ $\rho_{\mathcal{H}(-1)^{\prime}}^{2}$ (which distinguish e.g. between $V$ and $V^{*}$ for a representation of $\mathfrak{s l}(V))$, and the dimensions of $\left(\rho_{\mathcal{H}(-1)^{\prime}}^{1} \otimes \rho_{\mathcal{H}(-1)^{\prime}}^{2}\right)(U \mathfrak{g})$, which often determines the number of irreducible components in $\left(\rho_{\mathcal{H}(-1)^{\prime}}^{1} \otimes \rho_{\mathcal{H}(-1)^{\prime}}^{2}\right)$. The result is tabulated below. In this table, $S^{2} V$ denote the symmetric square of $V$, and $F_{[2,1]}$ denotes the Schur functor associated to the partition [2, 1], so that $V^{\otimes 3}=S^{3} V \oplus \Lambda^{3} V \oplus 2 F_{[2,1]}(V)$.

7.3. The spetsial Hecke algebra. In view of the Broué-Malle-Michel 'Spetses' program, a specialization of interest is when all the $\lambda_{i}$ are equal. We
denote $\mathcal{H}_{s t}$ the Lie subalgebra of $\mathcal{H}$ generated by the $\sum_{k=1}^{e_{c}-1} s^{k}$ for $s \in c \subset \mathcal{S}$. We have $\mathcal{H}_{0} \subset \mathcal{H}_{s t} \subset \mathcal{H}$. The decomposition of $\mathcal{H}_{s t}$ for the exceptional groups $G_{4}, G_{25}$ were done in the previous section.

We contend ourselves here to deal with the groups $G(d, 1, r)$.
Proposition 7.5. Let $\boldsymbol{\lambda}=\left(\lambda_{0}, \ldots, \lambda_{d-1}\right)$ be a multipartition of $r$, $W=$ $G(d, 1, r)$, and $\rho \in \operatorname{Irr}(W)$ the representation of $W$ labelled by $\boldsymbol{\lambda}$. If $\lambda_{0} \neq \emptyset$, then $\rho_{\mathcal{H}_{s t}}$ is irreducible. If $\lambda_{0}=\emptyset$, then $\rho\left(\mathcal{H}_{s t}^{\prime}\right)=\rho\left(\mathcal{H}_{0}^{\prime}\right)$.
Proof. On note $P_{i}=(1 / d) \sum_{k=0}^{d-1} \rho\left(t_{i}\right)^{k}$. Letting $\mathbf{T}=\left(T_{0}, \ldots, T_{d-1}\right)$ be a multitableau of shape $\boldsymbol{\lambda}$, we have $P_{i} \mathbf{T}=0$ if $i \notin T_{0}$ and $P_{i} \mathbf{T}=\mathbf{T}$ otherwise. If $\lambda_{0}=\emptyset$, then $\rho\left(\mathrm{UH}_{s t}\right)=\rho\left(\mathrm{U} \mathcal{H}_{0}\right)$ hence $\rho_{\mathcal{H}_{s t}}$ is semisimple.

Now assume $\lambda_{0} \neq \emptyset$ and $U$ be a subspace setwise invariant under $\mathcal{H}_{s t}$. Since $\mathcal{H}_{0} \subset \mathcal{H}_{s t}$ it is invariant under $W_{0}=G(d, d, r)$, hence a sum of the irreducible components. In particular, it is irreducible unless the sequence $\lambda_{0}, \lambda_{1}, \ldots$ has a period $0<u<d$. In that case, the irreducible components for $W_{0}$ are the eigenspaces of the endomorphism $S$ of order $d / u$ defined by $S(\mathbf{T})=\left(T_{u}, T_{1+u}, \ldots, T_{d-1+u}\right)$ (see MM] $\S 2.4$ ), hence $U$ is setwise invariant $S$. Now let $v=\sum \alpha_{\mathbf{T}} \mathbf{T} \in U$ with $v \neq 0$, that is $\alpha_{\mathbf{T}^{0}} \neq 0$ for some multitableau $\mathbf{T}^{0}$. Since $\lambda_{0} \neq \emptyset$ there exists some $i$ in $\left(\mathbf{T}^{0}\right)_{0}$. Then $w=P_{i} v=$ $\sum_{i \in \mathbf{T}_{0}} \alpha_{\mathbf{T}} \mathbf{T} \in U \backslash\{0\}$. By definition of $S$ the family $w, S(w), \ldots, S^{d-1}(w) \in$ $U$ is free, hence the $\sum_{k=0}^{d / u-1} \zeta^{s k} S^{k}(w)$ for $\zeta=\exp (2 \mathrm{i} \pi d / u)$ afford eigenvectors for all eigenvalues of $S$. It follows that $U$ meets every irreducible components of the restriction to $W_{0}$, hence $U$ is the whole space and $\rho_{\mathcal{H}_{s t}}$ is irreducible.

We assume $r \geq 3$.
Proposition 7.6. Let $W=G(d, 1, r)$ with $r \geq 3$, and $W_{0}=G(d, d, r)<W$. Let $\rho^{1}, \rho^{2} \in \operatorname{Irr}(W)$ associated to multipartitions $\boldsymbol{\lambda}, \boldsymbol{\mu}$. If both $\boldsymbol{\lambda}, \boldsymbol{\mu}$ have $a$ single nonempty part, then $\rho_{\mathcal{H}_{s t}^{\prime}}^{1} \simeq \rho_{\mathcal{H}_{s t}^{\prime}}^{2}$ iff this single part is the same. Assuming this is not the case, $\rho_{\mathcal{H}_{s t}^{\prime}}^{1} \simeq \rho_{\mathcal{H}_{s t}^{\prime}}^{2}$ iff $\operatorname{Res}_{W_{0}} \rho^{1}=\operatorname{Res}_{W_{0}} \rho^{2}$ when $\lambda_{0}=\mu_{0}=\emptyset$, and $\rho_{\mathcal{H}_{s t}^{\prime}}^{1} \simeq \rho_{\mathcal{H}_{s t}^{\prime}}^{2}$ iff $\boldsymbol{\lambda}=\boldsymbol{\mu}$ otherwise.
Proof. We assume that $\rho_{\mathcal{H}_{s t}^{\prime}}^{2}=\rho_{\mathcal{H}_{s t}^{\prime}}^{1}$. Since $\rho_{\mathcal{H}_{0}^{\prime}}^{1} \simeq \rho_{\mathcal{H}_{0}^{\prime}}^{2}$, we know from Ma09a that $\rho^{2}$ is associated to a multipartition $\boldsymbol{\mu}=\left(\mu_{0}, \ldots, \mu_{d-1}\right)$ with $\mu_{i}=\lambda_{i+k}$ for all $i$ and a given $k \in[1, d-1]$. We thus can assume that $V_{\rho^{1}}=$ $V_{\rho^{2}}$ has for basis the collection of multitableaux of shape $\boldsymbol{\lambda}$, with $\rho^{1}$ affording the usual action on them, $\rho^{1}(w)=\rho^{2}(w)$ for $w \in W_{0}$, and $\rho^{2}\left(t_{i}\right) \mathbf{T}=\zeta^{j} \mathbf{T}$ iff $\rho^{1}\left(t_{i}\right) \mathbf{T}=\zeta^{j-k}$. Now let $\mathbf{t}_{i}=\sum_{j=0}^{d-1} t_{i}^{j}$. Since $\rho_{\mathcal{H}_{s t}^{\prime}}^{1} \simeq \rho_{\mathcal{H}_{s t}^{\prime}}^{2}$ we have $\rho^{2}\left(\mathbf{t}_{i}\right)=\rho^{1}\left(\mathbf{t}_{i}\right)+\omega_{i}$ for some $\omega_{i} \in \mathbb{C}$. Since $\operatorname{Sp}\left(\rho^{1}\left(\mathbf{t}_{i}\right)\right), \operatorname{Sp}\left(\rho^{2}\left(\mathbf{t}_{i}\right)\right) \subset\{0, d\}$ we get that, either the $\rho^{1}\left(\mathbf{t}_{i}\right)$ are scalars, or $\omega_{i}=0$ for all $i$. If the $\rho^{1}\left(\mathbf{t}_{i}\right)$ are not scalars, then $\rho^{1}\left(\mathbf{t}_{i}\right)=\rho^{2}\left(\mathbf{t}_{i}\right)$ for all $i$, and also $\lambda_{0} \neq \emptyset$ (otherwise $\rho^{1}\left(\mathbf{t}_{i}\right)=0$ ). Let then $\mathbf{T}$ be a multitableau of shape $\boldsymbol{\lambda}$ with $1 \in T_{0}$. We have $\rho^{1}\left(\mathbf{t}_{1}\right) \mathbf{T}=d \mathbf{T}$ and $\rho^{2}\left(\mathbf{t}_{1}\right) \mathbf{T}=0$ unless $k=0$, which implies $\rho^{1}=\rho^{2}$.

We now assume that the $\rho^{1}\left(\mathbf{t}_{i}\right), \rho^{2}\left(\mathbf{t}_{i}\right)$ are scalars. Then $\rho_{\mathcal{H}_{s t}^{\prime}}^{1} \simeq \rho_{\mathcal{H}_{s t}^{\prime}}^{2}$ iff $\rho_{\mathcal{H}_{0}^{\prime}}^{1} \simeq \rho_{\mathcal{H}_{0}^{\prime}}^{2}$, which is equivalent to $\operatorname{Res}_{W_{0}} \rho^{1}=\operatorname{Res}_{W_{0}} \rho^{2}$ by Ma09a. This case means that either $\boldsymbol{\lambda}, \boldsymbol{\mu}$ have a single part, that is the $\rho^{1}\left(t_{i}\right)$ and $\rho^{2}\left(t_{i}\right)$ themselves are scalars, and then $\rho_{\mathcal{H}_{0}^{\prime}}^{1} \simeq \rho_{\mathcal{H}_{0}^{\prime}}^{2}$ implies that these single parts
are the same, or $\lambda_{0}=\mu_{0}=\emptyset$. This concludes the proof, as the converse implications are obvious.

Proposition 7.7. Let $W=G(d, 1, r)$ with $r \geq 3$. Let $\rho \in \operatorname{Irr}(W)$. If $\rho^{2} \in \operatorname{Irr}(W)$ satisfies $\left(\rho^{2}\right)_{\mathcal{H}_{s t}^{\prime}} \simeq\left(\rho_{\mathcal{H}_{s t}^{\prime}}\right)^{*}$, then $\left(\rho^{2}\right)_{\mathcal{H}^{\prime}} \simeq\left(\rho_{\mathcal{H}^{\prime}}\right)^{*}$.
Proof. Recall from [Ma09a] that, if $\rho_{0}$ is the restriction to $W_{0}=G(d, d, r)$ of $\rho \in \operatorname{Irr}(W)$ associated to $\boldsymbol{\lambda}=\left(\lambda_{0}, \lambda_{1}, \ldots, \lambda_{d-1}\right)$, then $\rho_{0}^{*} \otimes \epsilon$ is the restriction to $W_{0}$ of the representation labelled $\boldsymbol{\lambda}^{*}:=\left(\lambda_{0}^{\prime}, \lambda_{d-1}^{\prime}, \ldots, \lambda_{1}^{\prime}\right)$.

Assume $\rho, \rho^{2} \in \operatorname{Irr}(W)$ with $\left(\rho_{\mathcal{H}_{s t}}\right)^{*} \simeq \rho_{\mathcal{H}_{s t}^{\prime}}^{2}$. We have $\left(\rho_{\mathcal{H}_{s t}}\right)_{\mid \mathcal{H}_{0}^{\prime}}^{*} \simeq$ $\left(\rho_{\mathcal{H}_{0}^{\prime}}\right)^{*} \simeq\left(\left(\rho_{\mid W_{0}}\right)^{*} \otimes \epsilon\right)_{\mathcal{H}_{0}^{\prime}}$. It follows that $\mu_{i}=\lambda_{k-i}^{\prime}$ for some $k \in[1, d-1]$, by Ma09a. We define a linear isomorphism $V_{\rho} \rightarrow V_{\rho^{2}}$ by $\sigma(\mathbf{T})=\mathbf{T}^{\prime}:=$ $\left(T_{0+k}^{\prime}, \ldots, T_{j+k}^{\prime}, \ldots, T_{1+k}^{\prime}\right)$, where $T^{\prime}$ denotes the transpose of the (standard) tableau $T$. Transporting the representation $\rho^{2}$ to $V_{\rho^{1}}$ using $\sigma$, this identify $\rho^{2}(x)$ with $-{ }^{t} \rho(x)$ for any $x \in \mathcal{H}_{0}$. For $\mathbf{T}$ a multitableau of shape $\boldsymbol{\lambda}$, we have (under $\sigma$ ) $\rho^{2}\left(t_{i}\right) \mathbf{T}=\zeta^{j} \mathbf{T}$ iff $\rho^{1}\left(t_{i}\right) \mathbf{T}=\zeta^{k-j} \mathbf{T}$. Since $\rho^{1}\left(\mathbf{t}_{i}\right)$ and $\rho^{2}\left(\mathbf{t}_{\mathbf{i}}\right)$ have spectrum $\{0, d\}$, the only possibility for $\rho^{2}\left(\mathbf{t}_{i}\right)$ to be conjugate to $\omega_{i}-{ }^{t} \rho^{1}\left(\mathbf{t}_{i}\right)$ for some scalar $\omega_{i}$ is that $\omega_{i}=d$, and $\rho^{1}\left(\mathbf{t}_{i}\right) \mathbf{T}=d \mathbf{T}$ iff $\rho^{2}\left(\mathbf{t}_{i}\right) \mathbf{T}=0$. Let $a \in[1, d-1]$ with $\lambda_{a} \neq \emptyset$, and choose $\mathbf{T}$ with $1 \in T_{a}$. Then $\rho^{1}\left(\mathbf{t}_{1}\right) \mathbf{T}=0$, as $a \neq 0$, hence $\rho^{2}\left(\mathbf{t}_{1}\right) \mathbf{T}=d$. This implies $\rho^{2}\left(t_{1}\right) \mathbf{T}=\mathbf{T}=\zeta^{0} \mathbf{T}$, whence $\rho^{1}\left(t_{1}\right) \mathbf{T}=\zeta^{k} \mathbf{T}, a \equiv k$ modulo $d$ and $a=k$. Then $\mu_{k}=\lambda_{k-k}^{\prime}=\lambda_{0}^{\prime}$ and $\mu_{0}=\lambda_{k-0}^{\prime}=\lambda_{k}^{\prime}$. In that case we have $\rho^{2}=\left(\rho^{1}\right)^{*} \otimes \chi$ with $\chi_{\mid W_{0}}=\epsilon$ and $\chi\left(t_{1}\right)=\zeta^{k}$, hence $\rho_{\mathcal{H}^{\prime}} \simeq\left(\rho^{2}\right)_{\mathcal{H}^{\prime}}$.
Proposition 7.8. Let $W=G(d, 1, r)$ with $r \geq 3$ and $\rho \in \operatorname{Irr}(W)$ associated to a multipartition $\boldsymbol{\lambda}$ with at least 2 parts. If $\lambda_{0}=\emptyset$ then $\rho\left(\mathcal{H}_{s t}^{\prime}\right)=\rho\left(\mathcal{H}_{0}^{\prime}\right)$, otherwise $\rho\left(\mathcal{H}_{s t}^{\prime}\right)=\rho\left(\mathcal{H}_{s}^{\prime}\right)=\rho\left(\mathcal{H}^{\prime}\right)$.
Proof. The case $\lambda_{0}=\emptyset$ is clear, so we assume $\lambda_{0} \neq \emptyset$. In case $\rho \in \operatorname{QRef}(W)$ we can write $\rho\left(\mathbf{t}_{i}\right)=\alpha \rho\left(t_{i}\right)+\beta$ for some $\alpha, \beta$ with $\alpha \neq 0$, hence $\rho\left(\mathcal{H}_{s}\right) \supset$ $\mathfrak{s l}\left(V_{\rho}\right)$ implies $\rho\left(\mathcal{H}_{s t}\right) \subset \mathfrak{s l}\left(V_{\rho}\right)$ hence $\rho\left(\mathcal{H}_{s t}^{\prime}\right)=\mathfrak{s l}\left(V_{\rho}\right)$, and this implies $\rho\left(\mathcal{H}_{s t}^{\prime}\right)=\rho\left(\mathcal{H}_{s}^{\prime}\right)$ if $\rho \in \Lambda \operatorname{Ref}(W)$ and $\lambda_{0} \neq \emptyset$. The rest of the proof then follows verbatim the lines of 93.1 using the irreducibility of $\rho_{\mathcal{H}_{s t}^{\prime}}$ proved by proposition [7.5, and that $\rho_{\mathcal{H}_{s t}^{\prime}}$ is selfdual if and only if $\rho_{\mathcal{H}^{\prime}}$ is so, by proposition 7.7. The only change to make is in section 3.1.3, in case $\boldsymbol{\lambda}$ has the form $\left(\lambda_{0}, \ldots, \lambda_{0}, \ldots\right)$ and $\rho$ factorizes through $G(d, d / 2, r)$. But then $(2 / d) \rho\left(\mathbf{t}_{i}\right)-1=\rho\left(t_{i}\right)$ and Ma09a can also be applied, as $\rho\left(\mathcal{H}_{s t}\right)$ equals the image of the infinitesimal Hecke algebra of $G(d, d / 2, r)$ in the corresponding representation.

## 8. Relations between $\operatorname{Ad}(g)$ and $\operatorname{ad}(g)$

8.1. Preliminaries about cyclotomic fields. We first need various preliminary results on cyclotomic fields.
Lemma 8.1. $\mathbb{Q}\left(\mu_{n}\right)=\mathbb{Q}\left(\mu_{m}\right)$ with $m \leq n$ if and only if $n=2 m$ with $m$ odd.

Proof. Since $\mathbb{Q}\left(\mu_{n}\right) \cap \mathbb{Q}\left(\mu_{m}\right)=\mathbb{Q}\left(\mu_{\operatorname{gcd}(m, n)}\right)$ we can assume that $m$ divides $n$. Letting $\varphi$ denote the Euler function, by taking Galois groups this yiels $\varphi(m)=\varphi(n)$. Since, for $p$ prime, $\varphi\left(p^{r}\right)=p^{r-1}(p-1)$, we get $\varphi(m)=\varphi(n)$ implies $n=m a$ with $a$ prime to $m$ and $\varphi(a)=1$, that is $a=2$.

We will use the following version of Goursat lemma.
Lemma 8.2. Let $K$ denote a finite Galois extension of $\mathbb{Q}$ and $B$ a unital $\mathbb{Q}$-subalgebra of $K^{2}$ with $p_{1}(B)=p_{2}(B)=K$, where $p_{i}$ is the $i$-th projection $K^{2} \rightarrow K$. Then either $B=K^{2}$ or there exists $\sigma \in \operatorname{Gal}(K \mid \mathbb{Q})$ with $B=$ $\{(x, \sigma(x)) \mid x \in K\}$.
Proof. If $B$ is not an integral domain, then it contains some nonzero and noninvertible element of $K^{2}$, that can chosen (by symmetry) of the form $(0, x)$ for $x \neq 0$. Since $p_{2}$ is onto we habe $b \in B$ with $p_{2}(b)=x^{-1}$, hence $(0,1)=(0, x) b \in B$ and similarly $(1,0)=1-(0,1) \in B$. Then choosing for any $x, y \in K$ preimages $a, b \in B$ with $p_{1}(a)=x$ and $p_{2}(b)=y$ we get $(x, y)=a(1,0)+b(0,1) \in B$ and $B=K^{2}$. Now assume that $B$ is an integral domain. Since $B$ has finite dimension over $\mathbb{Q}$ it is a field. Then the $\left(p_{i}\right)_{\mid B}: B \rightarrow K$ are injective, so they are isomorphisms. Letting $\sigma=$ $p_{2} \circ\left(p_{1}\right)_{\mid B}^{-1} \in \operatorname{Gal}(K \mid \mathbb{Q})$ we thus get $B=\{(x, \sigma(x) \mid x \in K\}$.
Lemma 8.3. Let $B$ be a unital $\mathbb{Q}$-subalgebra of $A=\prod_{d \mid n} \mathbb{Q}\left(\mu_{d}\right)$ such that $p_{d}(B)=\mathbb{Q}\left(\mu_{d}\right)$ where $p_{d}=A \rightarrow \mathbb{Q}\left(\mu_{d}\right)$ is the natural projection. We assume that, if $\mathbb{Q}\left(\mu_{d}\right)=\mathbb{Q}\left(\mu_{d^{\prime}}\right)$ there exists $b \in B$ such that $p_{d^{\prime}}(b) \notin$ $\operatorname{Gal}\left(\mathbb{Q}\left(\mu_{d}\right) \mid \mathbb{Q}\right) p_{d}(b)$. Then $B=A$.
Proof. If $\mathbb{Q}\left(\mu_{d}\right)=\mathbb{Q}\left(\mu_{d^{\prime}}\right)$ with $d, d^{\prime}$ dividing $n$ we can assume $d^{\prime}=2 d$ with $d$ odd. Then the projection of $B$ to $\mathbb{Q}\left(\mu_{d}\right) \times \mathbb{Q}\left(\mu_{d^{\prime}}\right)$ is a unital $\mathbb{Q}$ subalgebra that satisfies the assumptions of the previous lemma, hence $p_{d^{\prime}}(b) \notin \operatorname{Gal}\left(\mathbb{Q}\left(\mu_{d}\right) \mid \mathbb{Q}\right) p_{d}(b)$ implies that it is equal to $\mathbb{Q}\left(\mu_{d}\right) \times \mathbb{Q}\left(\mu_{d^{\prime}}\right)$. Let $D$ the set of divisors of $n$. For $I \subset D$, we denote $p_{I}: A \rightarrow A_{I}=\prod_{d \in I} \mathbb{Q}\left(\mu_{d}\right)$ the natural projection, and by contradiction we choose a minimal $I$ with $p_{I}(B) \neq A_{I}$. The situation $\mathbb{Q}\left(\mu_{d}\right)=\mathbb{Q}\left(\mu_{d^{\prime}}\right)$ for all $d, d^{\prime} \in I$ implies $|I| \leq 2$ by lemma 8.1, and is excluded for $|I|=1$ by the hypothesis, and for $|I|=2$ by lemma 8.2, So there exists $d_{1}, d_{2} \in I$ with $\mathbb{Q}\left(\mu_{d_{1}}\right) \neq \mathbb{Q}\left(\mu_{d_{2}}\right)$. Since $\mathbb{Q}\left(\mu_{d}\right) \subset \mathbb{Q}\left(\mu_{\infty}\right)$ is uniquely determined by its Galois group over $\mathbb{Q}$, this implies $\mathbb{Q}\left(\mu_{d_{1}}\right) \nsucceq \mathbb{Q}\left(\mu_{d_{2}}\right)$.

If $p_{I}(B)$ was an integral domain, it would be a field as $\operatorname{dim}_{Q} p_{I}(B) \leq$ $\operatorname{dim} B \leq \operatorname{dim} A<\infty$. Then $p_{d_{1}}$ and $p_{d_{2}}$ would induce isomorphims $\mathbb{Q}\left(\mu_{d_{1}}\right) \simeq$ $B \simeq \mathbb{Q}\left(\mu_{d_{2}}\right)$, a contradiction. So there exists $b \in B$ with $p_{I}(b) \neq 0$ and $p_{d}(b)=0$ for some $d \in I$. Let $J=\left\{d \in I \mid p_{d}(b)=0\right\} \neq \emptyset$. We have $I \backslash J \neq \emptyset$ as $p_{I}(b) \neq 0$, and $p_{I \backslash J}(B)=A_{I \backslash J}, p_{J}(B)=A_{J}$ by the minimality assumption.

Since $p_{J \backslash I}(b)$ is invertible in $A_{I \backslash J}$ it follows that there exists $c \in B$ with $p_{J \backslash I}(c b)=1$. Since $p_{I}(b)=0$ we have $p_{I}(c b)=0$. Then, choosing for any $(x, y) \in p_{J}(B) \times p_{I \backslash J}(B)$ preimages $u, v \in B$ with $x=p_{J}(u), y=p_{I \backslash J}(v)$, we have $(x, y)=p_{I}(u(1-c b)+v c b)$ with $u(1-c b)+v c b \in B$, hence $p_{I}(B)=$ $p_{J}(B) \times p_{I \backslash J}(B)=A_{I} \times A_{J \backslash I}=A_{I}$, a contradiction. It follows that, for $I \subset D$ we have $p_{I}(B)=A_{I}$ and in particular $B=A_{D}=A$.

In our situation, we will use the following Galois-theoretic lemma.
Lemma 8.4. Let $\zeta$ be a primitive $d$-root of 1 and $a \geq 1$. Then $\mathbb{Q}(\zeta)$ is generated as a unital $\mathbb{Q}$-algebra by $u=(\zeta-1)^{d a}$ if $d$, a are odd. Otherwise it is generated by $u$ and,

- if $d \equiv 0 \bmod 4$, by $\left(\zeta^{d / 2}-1\right)\left(\zeta^{d / 4}-1\right)^{2}\left(\zeta^{d / 2}-1\right)^{2(a-1)} \in \mathrm{i} \mathbb{Q}^{\times}$;
- if $d \equiv 2 \bmod 4$, by $\left(\zeta^{d / 2}-1\right)(\zeta-1)^{d / 2}\left(\zeta^{d / 2}-1\right)^{2(a-1)} \in \mathrm{i} \mathbb{Q}^{\times}$;
- if $d$ is odd and a even, by $\left(\zeta^{a}-1\right)^{d}$.

Proof. Since $\operatorname{Gal}(\mathbb{Q}(\zeta) \mid \mathbb{Q})$ is abelian, any intermediate extension of $\mathbb{Q}$ is Galois. Let $K$ be the one generated by the elements in the statement, depending on $d$ and $a$. We need to show that $\sigma \in \operatorname{Gal}(\mathbb{Q}(\zeta) \mid K)$ implies $\sigma=1$. By contradiction we assume $\sigma \neq 1$. Since $\sigma \in \operatorname{Gal}(\mathbb{Q}(\zeta) \mid \mathbb{Q})$ we have $\sigma(\zeta)=\zeta^{\alpha}$ for some $1 \leq \alpha \leq d-1$ prime to $d$.

For any $k \geq 1,(\zeta-1)^{k}$ is invariant under $\sigma$ iff $\left(\zeta^{\alpha}-1\right)^{k}=(\zeta-1)^{k}$. We can assume $\zeta=e^{2 \mathrm{i} \pi / d}$, and then $\zeta^{\alpha}-1=e^{\alpha \mathrm{i} \pi / d}(2 \mathrm{i}) \sin (\alpha \pi / d)$ hence $\left|\zeta^{\alpha}-1\right|^{k}=|\zeta-1|^{k}$ iff $\sin (\alpha \pi / d)=\sin (\pi / d)$ iff $\alpha=1$ or $\alpha=d-1$. For $\alpha=d-1,\left(\zeta^{\alpha}-1\right)^{k}=(\zeta-1)^{k}$ can be written $e^{k(d-1) \mathrm{i} \pi / d}=e^{k \mathrm{i} \pi / d}$ that is $k(2-d) \in 2 d \mathbb{Z}$.
Letting $k=d a$, it follows that $\sigma(u)=u$ with $\sigma \neq 1$ implies that $\sigma$ is the complex conjugation. If $d a$ is odd, then so are $d$ and $d-2$, hence $d a(2-d) \notin 2 d \mathbb{Z}$ and a contradiction. If $d$ is odd and $a$ even, then $\zeta^{a}$ is a primitive $d$-th root of 1 , and we get from the previous argument that $\sigma$ fixes $\left(\zeta^{a}-1\right)^{d}$ iff $\sigma=1$. We thus assume that $d$ is even, and $\sigma$ the complex conjugation. Then $K$ is generated by some $(\zeta-1)^{k}$ and any element in $\mathrm{i} \mathbb{Q}^{\times} \cap K$, hence $\sigma=1$, a contradiction that concludes the proof.

### 8.2. On the algebra $\mathbb{Q}[X, Y] /\left(X^{n}-1, Y^{n}-1\right)$.

Proposition 8.5. Let $n \geq 2$. Then $X Y^{n-1}$ belongs to the unital $\mathbb{Q}$ subalgebra of $\mathbb{Q}[X, Y] /\left(X^{n}-1, Y^{n}-1\right)$ generated by the elements $X^{k}-Y^{k}$ for $1 \leq k \leq n$. It also belongs to the subalgebra generated by $X-Y$ if $n$ is odd or $n=2$.

Proof. Let $C=\mathbb{Q}[X, Y] /\left(X^{n}-1, Y^{n}-1\right)$ and $C_{0}$ the subspace spanned (over $\mathbb{Q}$ ) by the monomials in $X, Y$ of total degree 0 modulo $n$. It has dimension $n$ and is spanned by the elements $X^{k} Y^{-k}$ for $0 \leq k<n$. It is also a subalgebra of $C$, generated by $Z=X Y^{n-1}=X Y^{-1}$, since $Z^{k}=X^{k} Y^{-k}=X^{k} Y^{n-k}$. We need to show that $Z$ belongs to the subalgebra $E$ of $C$ generated by the $X^{k}-Y^{k}$ and, for $n$ odd or $n=2$, to the subalgebra $E_{1}$ of $E$ generated by $X-Y$. The natural $\mathbb{Q}$-algebra morphism $\mathbb{Q}[T] /\left(T^{n}-1\right) \rightarrow C_{0}$ that maps $T$ to $Z$ is onto because $T^{k}$ is mapped to $Z^{k}=X^{k} Y^{n-k}$ and is into by equality of dimensions, so we can identify $C_{0}$ with $\mathbb{Q}[T] /\left(T^{n}-1\right)=\prod_{d \mid n} \mathbb{Q}[T] / \Phi_{d}(T) \simeq$ $\prod_{d \mid n} \mathbb{Q}\left(\mu_{d}\right)=A$, where $\Phi_{d}$ denotes the $d$-th cyclotomic polynomial, and $\mathbb{Q}[T] / \Phi_{d}(T)$ is embedded in $\mathbb{C}$ through $T \mapsto e^{2 i \pi / d}$. We let $p_{d}: A \rightarrow \mathbb{Q}\left(\mu_{d}\right)$ denote the natural projections. Then $p_{d}(Z)=e^{2 i \pi / d}$ is a primitive $d$-th root of 1 . Let $B, B_{1}$ denote the subalgebras of $A$ corresponding to $E \cap C_{0}$ and $E_{1} \cap C_{0}$, respectively. For any $d \mid n$ and $a=n / d, B$ contains $(Z-1)^{d a},\left(Z^{a}-1\right)^{d}$ as well as, for $d$ divisible by $4,\left(Z^{d / 2}-1\right)\left(Z^{d / 4}-1\right)^{2}\left(Z^{d / 2}-1\right)^{2(a-1)}$, and, for $d$ even, $\left(Z^{d / 2}-1\right)(Z-1)^{d / 2}\left(Z^{d / 2}-1\right)^{2(a-1)} ; E_{1}$ contains $(Z-1)^{d a}$. We first assume $n$ odd. By lemma 8.4 we have $p_{d}\left(B_{1}\right)=\mathbb{Q}\left(\mu_{d}\right)$ for all $d \mid n$, by lemma 8.1 we have $\mathbb{Q}\left(\mu_{d}\right)=\mathbb{Q}\left(\mu_{d^{\prime}}\right) \Rightarrow d=d^{\prime}$ for $d, d^{\prime} \mid n$, and by lemma 8.3 this implies $B_{1}=A$ (hence $B=A, C_{0} \subset E_{1}$ and $X Y^{n-1} \in E_{1}$.). The case $n=2$ follows from $(X-Y)^{2}=2-2 X Y$ in $C$.

Now assume $n$ is even. If there exists $d_{1}<d_{2}$ with $d_{1}, d_{2}$ dividing $n$ such that $\mathbb{Q}\left(\mu_{d_{1}}\right)=\mathbb{Q}\left(\mu_{d_{2}}\right)$, by lemma 8.1 we have $d_{1}$ odd and $d_{2}=2 d_{1}$. We let $\zeta_{d}=p_{d}(Z)=e^{2 \mathrm{i} \pi / d}$. Then $\left(\zeta_{d_{1}}-1\right)^{n}=\left(\zeta_{d_{2}}^{2}-1\right)^{n}$ is the image of $\left(\zeta_{d_{2}}-1\right)^{n}$ by some $\sigma \in \operatorname{Gal}\left(\mathbb{Q}\left(\zeta_{d_{2}}\right) \mid \mathbb{Q}\right)$ iff there exists $1 \leq \alpha \leq d_{2}-1$ prime to $d_{2}$ with $\left(\zeta_{d_{2}}^{2}-1\right)^{n}=\left(\zeta_{d_{2}}^{\alpha}-1\right)^{n}$ hence $\sin \left(\alpha \pi / d_{2}\right)=\sin \left(2 \pi / d_{2}\right)$, that is $\alpha=2$ or $\alpha=d_{2}-2$. Since $d_{2}=2 d_{1}$ is even, this implies $\alpha$ even, contradicting $\alpha$ prime to $d_{2}$. Since $\left(\zeta_{d_{1}}-1\right)^{n}$ and $\left(\zeta_{d_{2}}-1\right)^{n}$ are the images under $p_{d_{1}}$ and $p_{d_{2}}$, respectively, of $(Z-1)^{n} \in B$, then $B \subset A$ satisfies the assumptions of lemma 8.3. Then $B=A, C_{0} \subset E$ and $X Y^{n-1} \in E$.

We now relate the endomorphisms $\operatorname{Ad}(g)$ and $\operatorname{ad}(g)$. Notice that $\operatorname{ad}\left(g^{k}\right)$ commutes with $\operatorname{ad}\left(g^{l}\right)$ for any $k, l$.

Theorem 8.6. Let $G$ be a finite group. For $g \in G$ we let $\operatorname{ad}(g), \operatorname{Ad}(g) \in$ $\operatorname{End}(\mathbb{Q} G)$ defined by $\operatorname{ad}(g): x \mapsto g x-x g$ and $\operatorname{Ad}(g): x \mapsto g x g^{-1}$. Let $n$ denote the order of $g \in G$. Then
(1) $\operatorname{Ad}(g)$ is a polynomial in the $\operatorname{ad}\left(g^{k}\right), k \geq 1$ that depends only on $n$.
(2) Let $n$ denote the order of $g \in G$. If $n$ is odd or $n=2$ then $\operatorname{Ad}(g)$ is a polynomial in $\operatorname{ad}(g)$ that depends only on $n$.

Proof. Let $\Gamma \simeq \mathbb{Z} / n \mathbb{Z}$ denote the subgroup generated by $g$. The algebra $\mathbb{Q} G$ is a $\Gamma$-bimodule, that is a $\Gamma \times \Gamma$-module. It is thus enough to show that, for any complex $\Gamma$-bimodule $M$, then $\operatorname{Ad}(g)$ can be written as a rational polynomial in the $\operatorname{ad}\left(g^{k}\right)$, or in $\operatorname{ad}(g)$ if $n$ is even, that depends only on $n$. We can take $M$ irreducible, hence of dimension 1 and spanned by some nonzero $v \in M$, for which $g . v=\zeta^{r} v$ and $v . g=\zeta^{s} v$, with $\zeta$ some fixed primitive $n$-th root of 1. Then $\operatorname{ad}\left(g^{k}\right)(v)=\left(\left(\zeta^{r}\right)^{k}-\left(\zeta^{s}\right)^{k}\right) v$ and $\operatorname{Ad}(g)(v)=\left(\zeta^{r} \zeta^{-s}\right) v$. By proposition 8.5 we get that $X Y^{-1}$ is a rational polynomial in the $X^{k}-Y^{k}$, and in $X-Y$ for $n$ odd or $n=2$, inside $\mathbb{Q}[X, Y] /\left(X^{n}-1, Y^{n}-1\right)=\mathbb{Q}(\Gamma \times \Gamma)$, and the conclusion follows.

For small $n$, the polynomials in the statement are easy to find :

$$
\begin{array}{rl}
n=2 & \operatorname{Ad}(g)= \\
n=3 & 18 \operatorname{Ad}(g)= \\
= & 18 \operatorname{Id}+3 \operatorname{ad}(g)^{2} \\
n=4 & 8 \operatorname{Ad}(g)= \\
n=5 & 13750 \operatorname{Ad}(g)=3 \operatorname{ad}\left(g^{2}\right)^{2}-\operatorname{ad}(g)^{6} \\
n & 13750 \operatorname{Id}-5875 \operatorname{ad}(g)^{5}+2 \operatorname{ad}(g)^{2} \operatorname{ad}\left(g^{2}\right) \\
& -10 \operatorname{ad}(g)^{15}+3 \operatorname{ad}(g)^{20} \\
n=6 & 183456 \operatorname{Ad}(g)= \\
& 183456-89573 \operatorname{ad}(g)^{6}-2210 \operatorname{ad}(g)^{12} \\
& +55 \operatorname{ad}(g)^{18}-30576 \operatorname{ad}\left(g^{2}\right)^{3}+15288 \operatorname{ad}\left(g^{2}\right)^{3} \operatorname{ad}\left(g^{3}\right)^{2}
\end{array}
$$

We remark that it is not possible to express in general $\operatorname{Ad}(g)$ as a polynomial in $\operatorname{ad}(g)$ for $n>2$ even. Indeed, in $\mathbb{Q}[X, Y] /\left(X^{n}-Y^{n}\right), X Y^{-1}$ does not belong to the subalgebra generated by the $(X-Y)^{n}$, as $(X-Y)^{n}$ is symmetric in $X, Y$ and $X Y^{n-1}$ is not. Since this algebra is equal to the intersection of the subspace $C_{0}$ of homogeneous polynomials with total degree equal to 0 modulo $n$ with the subalgebra generated by $X-Y$, this proves that $X Y^{n-1}$ is not a polynomial in $X-Y$. Now there exists groups with a cyclic subgroup $\Gamma \simeq \mathbb{Z} / n \mathbb{Z}$, e.g. $\Gamma \imath \mathfrak{S}_{n} \simeq G(n, 1, n)$, which admit irreducible representations whose restriction to $\Gamma$ contains all irreducible representations of $\Gamma$. Taking
for $g$ a generator of $\Gamma$ it follows that $\mathbb{Q}[X, Y] /\left(X^{n}-1, Y^{n}-1\right)=\mathbb{Q}(\Gamma \times \Gamma)$ embeds in $\mathbb{Q} G$, hence $\operatorname{Ad}(g)$ is not a polynomial in $\operatorname{ad}(g)$ in these cases.
