

第二节

二重积分的计算法

一、利用直角坐标计算二重积分

二、利用极坐标计算二重积分

*三、二重积分的换元法

一、利用直角坐标计算二重积分

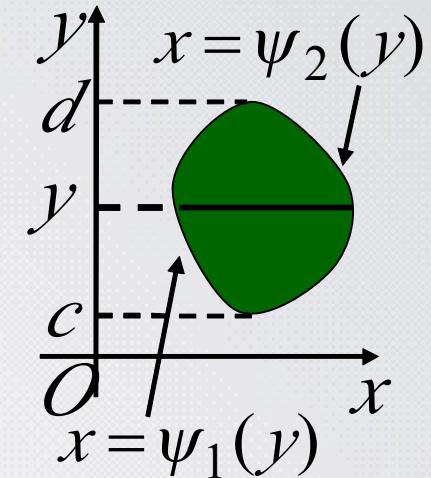

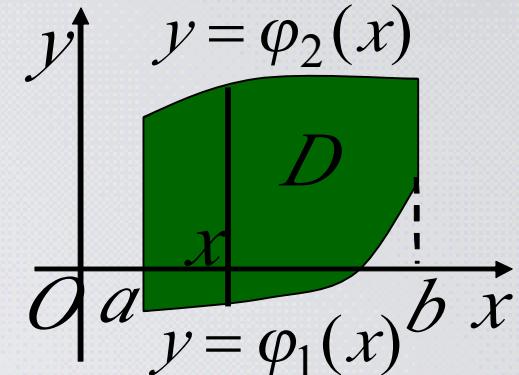

由曲顶柱体体积的计算可知, 当被积函数 $f(x, y) \geq 0$ 且在 D 上连续时, 若 D 为 X -型区域

$$D: \begin{cases} \varphi_1(x) \leq y \leq \varphi_2(x) \\ a \leq x \leq b \end{cases}$$

则 $\iint_D f(x, y) dx dy = \int_a^b dx \int_{\varphi_1(x)}^{\varphi_2(x)} f(x, y) dy$

若 D 为 Y -型区域 $D: \begin{cases} \psi_1(y) \leq x \leq \psi_2(y) \\ c \leq y \leq d \end{cases}$

则 $\iint_D f(x, y) dx dy = \int_c^d dy \int_{\psi_1(y)}^{\psi_2(y)} f(x, y) dx$

当被积函数 $f(x, y)$ 在 D 上变号时, 由于

$$f(x, y) = \underbrace{\frac{f(x, y) + |f(x, y)|}{2}}_{f_1(x, y)} - \underbrace{\frac{|f(x, y)| - f(x, y)}{2}}_{f_2(x, y)}$$

$f_1(x, y)$ $f_2(x, y)$ 均非负

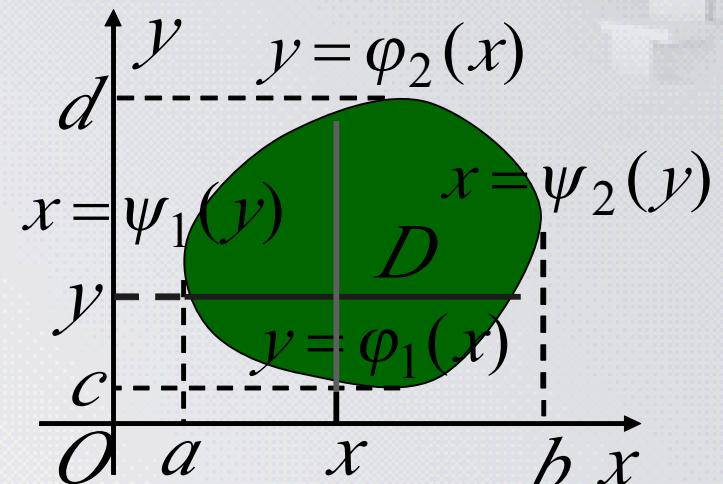

$$\begin{aligned} \therefore \iint_D f(x, y) dxdy &= \iint_D f_1(x, y) dxdy \\ &\quad - \iint_D f_2(x, y) dxdy \end{aligned}$$

因此上面讨论的累次积分法仍然有效 .

说明: (1) 若积分区域既是 X -型区域又是 Y -型区域,
则有 $\iint_D f(x, y) dx dy$

$$= \int_a^b dx \int_{\psi_1(y)}^{\varphi_2(x)} f(x, y) dy$$

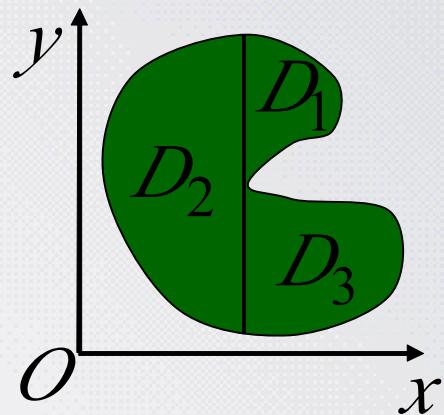

$$= \int_c^d dy \int_{\psi_1(y)}^{\varphi_2(x)} f(x, y) dx$$

为计算方便,可选择积分序,必要时还可以交换积分序.

(2) 若积分域较复杂,可将它分成若干 X -型域或 Y -型域,则

$$\iint_D = \iint_{D_1} + \iint_{D_2} + \iint_{D_3}$$

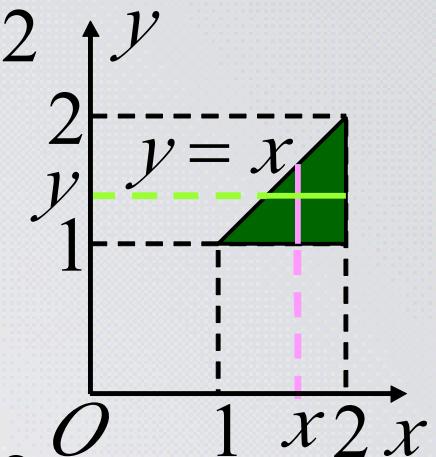

例1. 计算 $I = \iint_D xy d\sigma$, 其中 D 是直线 $y=1$, $x=2$, 及 $y=x$ 所围的闭区域.

解法1. 将 D 看作 X -型区域, 则 $D: \begin{cases} 1 \leq y \leq x \\ 1 \leq x \leq 2 \end{cases}$

$$I = \int_1^2 dx \int_1^x xy dy = \int_1^2 \left[\frac{1}{2}xy^2 \right]_1^x dx$$

$$= \int_1^2 \left[\frac{1}{2}x^3 - \frac{1}{2}x \right] dx = \frac{9}{8}$$

解法2. 将 D 看作 Y -型区域, 则 $D: \begin{cases} y \leq x \leq 2 \\ 1 \leq y \leq 2 \end{cases}$

$$I = \int_1^2 dy \int_y^2 xy dx = \int_1^2 \left[\frac{1}{2}x^2y \right]_y^2 dy = \int_1^2 \left[2y - \frac{1}{2}y^3 \right] dy = \frac{9}{8}$$

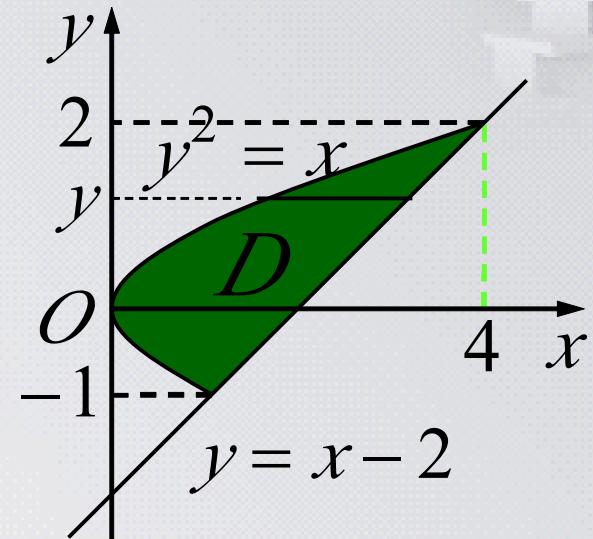

例2. 计算 $\iint_D xy \mathrm{d}\sigma$, 其中 D 是抛物线 $y^2 = x$ 及直线 $y = x - 2$ 所围成的闭区域.

解: 为计算简便, 先对 x 后对 y 积分,

则

$$D: \begin{cases} y^2 \leq x \leq y+2 \\ -1 \leq y \leq 2 \end{cases}$$

$$\begin{aligned} \therefore \iint_D xy \mathrm{d}\sigma &= \int_{-1}^2 \mathrm{d}y \int_{y^2}^{y+2} xy \mathrm{d}x \\ &= \int_{-1}^2 \left[\frac{1}{2}x^2y \right]_{y^2}^{y+2} \mathrm{d}y = \frac{1}{2} \int_{-1}^2 [y(y+2)^2 - y^5] \mathrm{d}y \\ &= \frac{1}{2} \left[\frac{y^4}{4} + \frac{4}{3}y^3 + 2y^2 - \frac{1}{6}y^6 \right]_{-1}^2 = \frac{45}{8} \end{aligned}$$

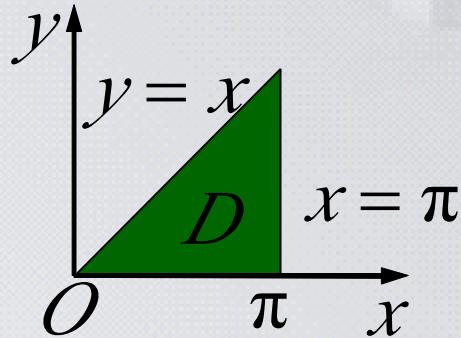

例3. 计算 $\iint_D \frac{\sin x}{x} dx dy$, 其中 D 是直线 $y=x$, $y=0$, $x=\pi$ 所围成的闭区域.

解: 由被积函数可知, 先对 x 积分不行,
因此取 D 为 X -型域:

$$D: \begin{cases} 0 \leq y \leq x \\ 0 \leq x \leq \pi \end{cases}$$

$$\begin{aligned} \therefore \iint_D \frac{\sin x}{x} dx dy &= \int_0^\pi \frac{\sin x}{x} dx \int_0^x dy \\ &= \int_0^\pi \sin x dx = [-\cos x]_0^\pi = 2 \end{aligned}$$

说明: 有些二次积分为了积分方便, 还需交换积分顺序.

例4. 交换下列积分顺序

$$I = \int_0^2 dx \int_0^{\frac{x^2}{2}} f(x, y) dy + \int_2^{2\sqrt{2}} dx \int_0^{\sqrt{8-x^2}} f(x, y) dy$$

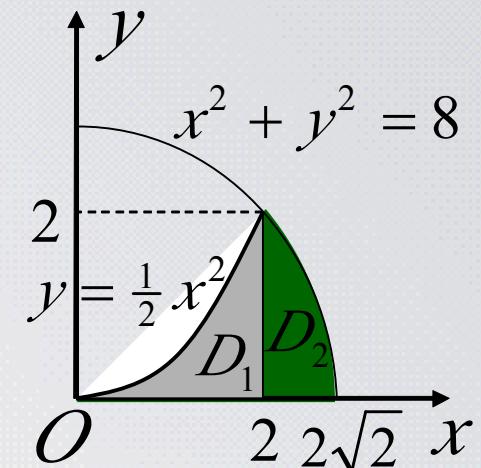

解：积分域由两部分组成：

$$D_1 : \begin{cases} 0 \leq y \leq \frac{1}{2}x^2 \\ 0 \leq x \leq 2 \end{cases}, \quad D_2 : \begin{cases} 0 \leq y \leq \sqrt{8-x^2} \\ 2 \leq x \leq 2\sqrt{2} \end{cases}$$

将 $D = D_1 + D_2$ 视为 Y -型区域，则

$$D : \begin{cases} \sqrt{2y} \leq x \leq \sqrt{8-y^2} \\ 0 \leq y \leq 2 \end{cases}$$

$$I = \iint_D f(x, y) dxdy = \int_0^2 dy \int_{\sqrt{2y}}^{\sqrt{8-y^2}} f(x, y) dx$$

例5. 计算 $I = \iint_D x \ln(y + \sqrt{1 + y^2}) dx dy$, 其中 D 由 $y = 4 - x^2$, $y = -3x$, $x = 1$ 所围成.

解: 令 $f(x, y) = x \ln(y + \sqrt{1 + y^2})$

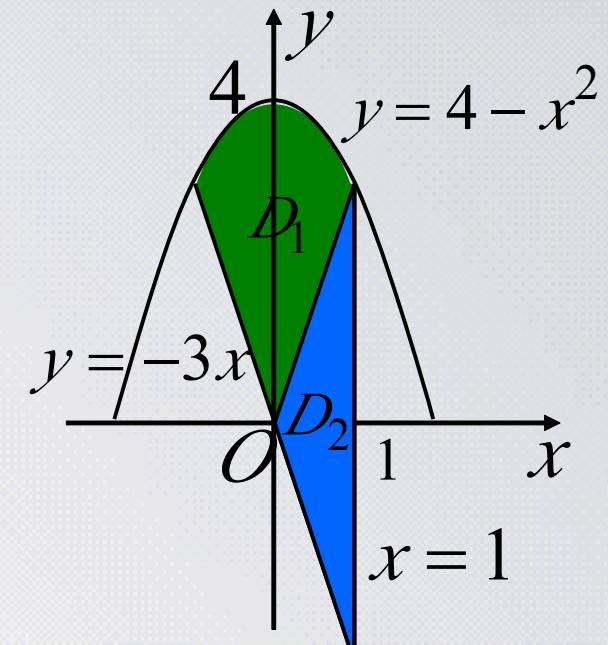

$$D = D_1 \cup D_2 \quad (\text{如图所示})$$

显然, 在 D_1 上, $f(-x, y) = -f(x, y)$

在 D_2 上, $f(x, -y) = -f(x, y)$

$$\therefore I = \iint_{D_1} x \ln(y + \sqrt{1 + y^2}) dx dy$$

$$+ \iint_{D_2} x \ln(y + \sqrt{1 + y^2}) dx dy = 0$$

二、利用极坐标计算二重积分
在极坐标系下,用同心圆 $r=$ 常数及射线 $\theta =$ 常数,分划区域 D 为

$$\Delta\sigma_k \quad (k=1,2,\cdots,n)$$

则除包含边界点的小区域外,小区域的面积

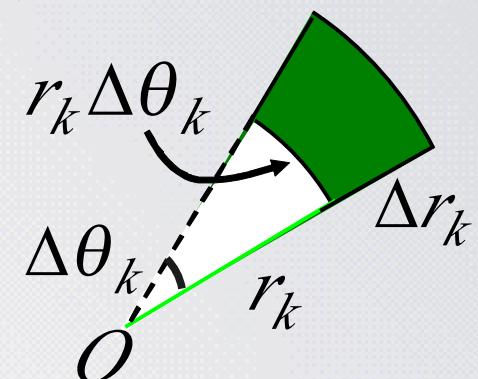

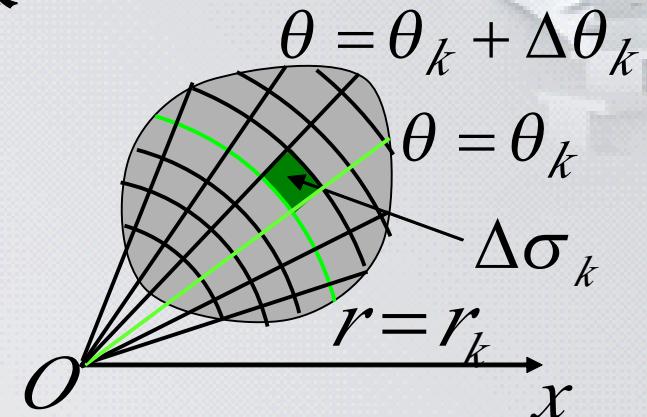

$$\Delta\sigma_k = \frac{1}{2}(r_k + \Delta r_k)^2 \cdot \Delta\theta_k - \frac{1}{2}r_k^2 \cdot \Delta\theta_k$$

$$= \frac{1}{2}[r_k + (r_k + \Delta r_k)]\Delta r_k \cdot \Delta\theta_k$$

$$= \bar{r}_k \Delta r_k \cdot \Delta\theta_k$$

在 $\Delta\sigma_k$ 内取点 $(\bar{r}_k, \bar{\theta}_k)$, 对应有

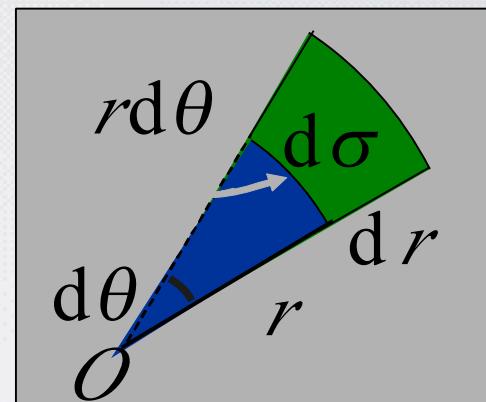

$$\xi_k = \bar{r}_k \cos \bar{\theta}_k, \quad \eta_k = \bar{r}_k \sin \bar{\theta}_k$$

$$\lim_{\lambda \rightarrow 0} \sum_{k=1}^n f(\xi_k, \eta_k) \Delta \sigma_k \\ = \lim_{\lambda \rightarrow 0} \sum_{k=1}^n f(\overline{r_k} \cos \overline{\theta_k}, \overline{r_k} \sin \overline{\theta_k}) \overline{r_k} \Delta r_k \Delta \theta_k$$

即 $\iint_D f(x, y) d\sigma = \iint_D f(r \cos \theta, r \sin \theta) r dr d\theta$

设 $D: \begin{cases} \varphi_1(\theta) \leq r \leq \varphi_2(\theta), \\ \alpha \leq \theta \leq \beta \end{cases}$, 则

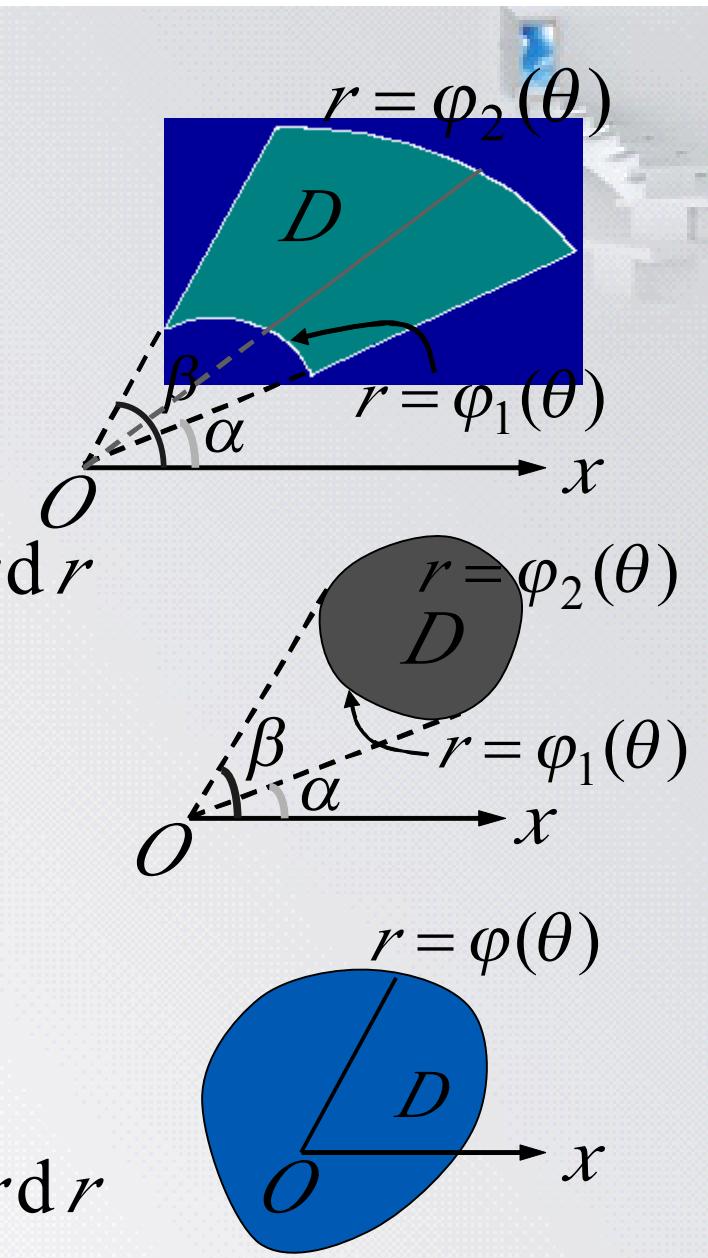

$$\iint_D f(r\cos\theta, r\sin\theta) r dr d\theta$$

$$= \int_{\alpha}^{\beta} d\theta \int_{\varphi_1(\theta)}^{\varphi_2(\theta)} f(r\cos\theta, r\sin\theta) r dr$$

特别, 对 $D: \begin{cases} 0 \leq r \leq \varphi(\theta) \\ 0 \leq \theta \leq 2\pi \end{cases}$

$$\iint_D f(r\cos\theta, r\sin\theta) r dr d\theta$$

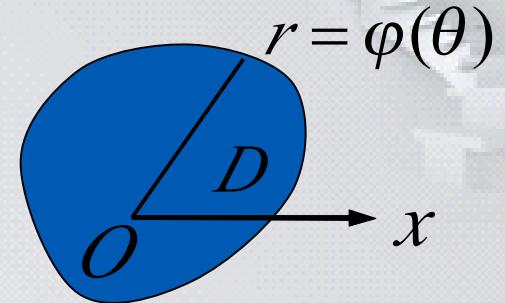

$$= \int_0^{2\pi} d\theta \int_0^{\varphi(\theta)} f(r\cos\theta, r\sin\theta) r dr$$

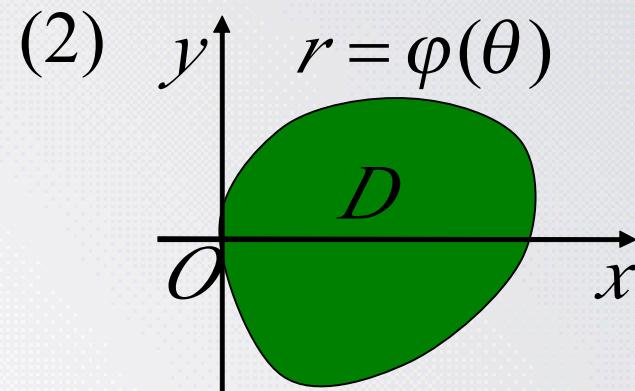

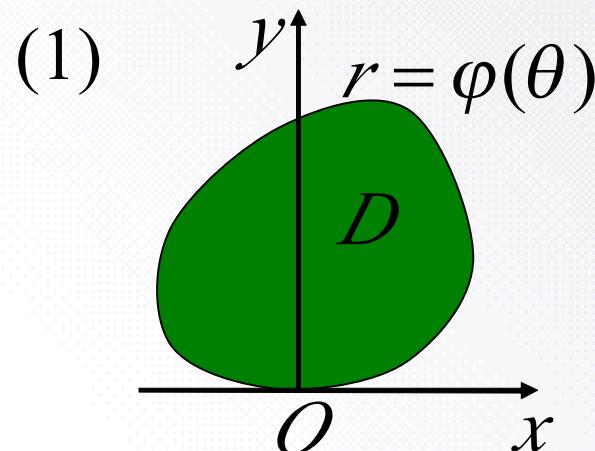

此时若 $f \equiv 1$ 则可求得 D 的面积

$$\sigma = \iint_D d\sigma = \frac{1}{2} \int_0^{2\pi} \varphi^2(\theta) d\theta$$

思考：下列各图中域 D 分别与 x, y 轴相切于原点，试问 θ 的变化范围是什么？

答：(1) $0 \leq \theta \leq \pi$ ；

(2) $-\frac{\pi}{2} \leq \theta \leq \frac{\pi}{2}$

例6. 计算 $\iint_D e^{-x^2-y^2} dx dy$, 其中 $D: x^2 + y^2 \leq a^2$.

解: 在极坐标系下 $D: \begin{cases} 0 \leq r \leq a \\ 0 \leq \theta \leq 2\pi \end{cases}$, 故

$$\begin{aligned} \text{原式} &= \iint_D e^{-r^2} r dr d\theta = \int_0^{2\pi} d\theta \int_0^a r e^{-r^2} dr \\ &= 2\pi \left[\frac{-1}{2} e^{-r^2} \right]_0^a = \pi(1 - e^{-a^2}) \end{aligned}$$

由于 e^{-x^2} 的原函数不是初等函数, 故本题无法用直角坐标计算.

注：利用上题可得一个在概率论与数理统计及工程上非常有用的反常积分公式

$$\int_0^{+\infty} e^{-x^2} dx = \frac{\sqrt{\pi}}{2} \quad ①$$

事实上， $\iint_{\mathbb{R}^2} e^{-x^2-y^2} dx dy = \int_{-\infty}^{+\infty} e^{-x^2} dx \int_{-\infty}^{+\infty} e^{-y^2} dy$

$$= 4 \left(\int_0^{+\infty} e^{-x^2} dx \right)^2$$

又 $\iint_{\mathbb{R}^2} e^{-x^2-y^2} dx dy = \lim_{a \rightarrow +\infty} \iint_{x^2+y^2 \leq a^2} e^{-x^2} dx$

$$= \lim_{a \rightarrow +\infty} \pi (1 - e^{-a^2}) = \pi$$

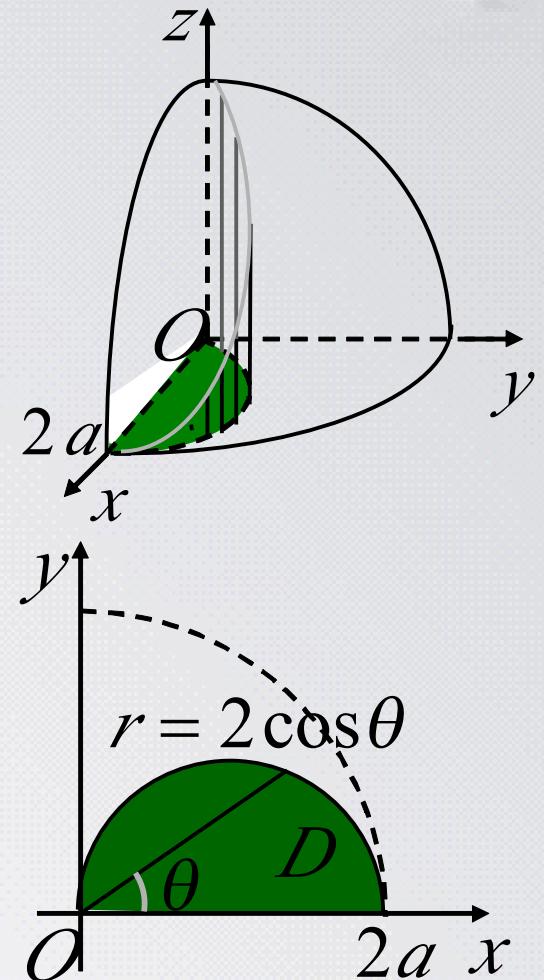

故①式成立。

例7. 求球体 $x^2 + y^2 + z^2 \leq 4a^2$ 被圆柱面 $x^2 + y^2 = 2ax$ ($a > 0$) 所截得的(含在柱面内的)立体的体积.

解: 设 $D: 0 \leq r \leq 2a\cos\theta, 0 \leq \theta \leq \frac{\pi}{2}$

由对称性可知

$$\begin{aligned} V &= 4 \iint_D \sqrt{4a^2 - r^2} r dr d\theta \\ &= 4 \int_0^{\pi/2} d\theta \int_0^{2a\cos\theta} \sqrt{4a^2 - r^2} r dr \\ &= \frac{32}{3} a^3 \int_0^{\pi/2} (1 - \sin^3\theta) d\theta \\ &= \frac{32}{3} a^3 \left(\frac{\pi}{2} - \frac{2}{3}\right) \end{aligned}$$

*三、二重积分换元法

定理：设 $f(x, y)$ 在闭域 D 上连续，变换：

$$T: \begin{cases} x = x(u, v) \\ y = y(u, v) \end{cases} \quad (u, v) \in D' \rightarrow D$$

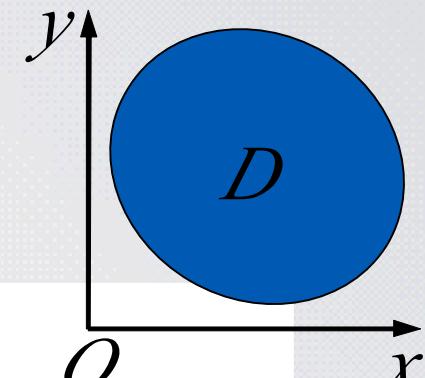

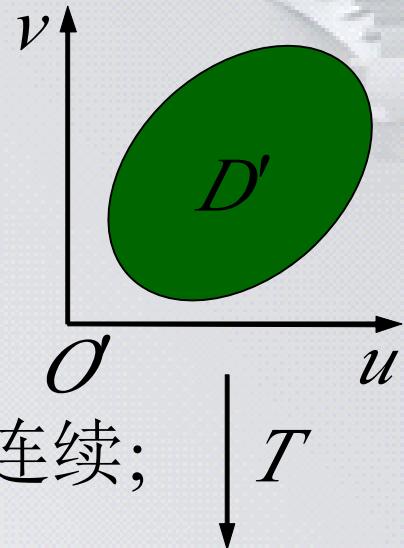

满足 (1) $x(u, v), y(u, v)$ 在 D' 上一阶偏导数连续；

(2) 在 D' 上 雅可比行列式

$$J(u, v) = \frac{\partial(x, y)}{\partial(u, v)} \neq 0;$$

(3) 变换 $T: D' \rightarrow D$ 是一一对应的，

则 $\iint_D f(x, y) dx dy = \iint_{D'} f(x(u, v), y(u, v)) |J(u, v)| du dv$

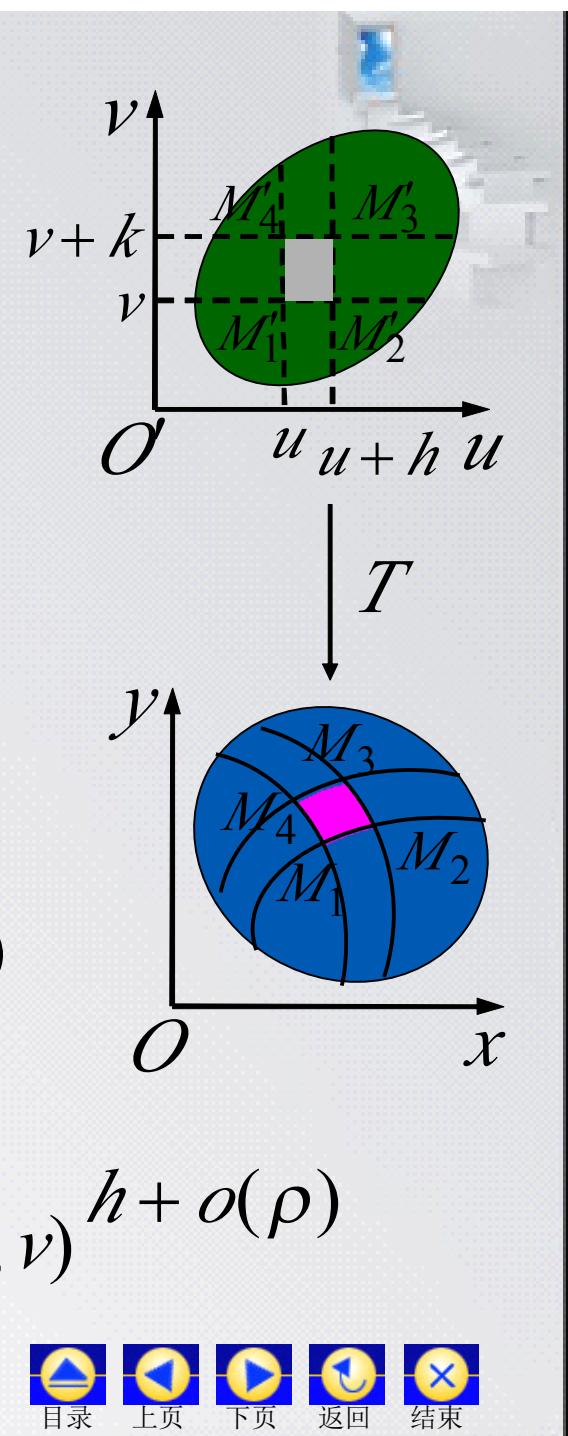

证：根据定理条件可知变换 T 可逆。
在 $uO\nu$ 坐标面上，用平行于坐标轴的直线分割区域 D' ，任取其中一个小矩形，其顶点为

$$\begin{array}{ll} M'_1(u, \nu), & M'_2(u+h, \nu), \\ M'_3(u+h, \nu+k), & M'_4(u, \nu+k). \end{array}$$

通过变换 T ，在 xOy 面上得到一个四边形，其对应顶点为 $M_i(x_i, y_i)$ ($i=1, 2, 3, 4$)

令 $\rho = \sqrt{h^2 + k^2}$ ，则

$$x_2 - x_1 = x(u+h, \nu) - x(u, \nu) = \frac{\partial x}{\partial u} \Big|_{(u, \nu)} h + o(\rho)$$

$$x_4 - x_1 = x(u, v+k) - x(u, v) = \frac{\partial x}{\partial v} \Big|_{(u, v)} k + o(\rho)$$

同理得 $y_2 - y_1 = \frac{\partial y}{\partial u} \Big|_{(u, v)} h + o(\rho)$

$$y_4 - y_1 = \frac{\partial y}{\partial v} \Big|_{(u, v)} k + o(\rho)$$

当 h, k 充分小时, 曲边四边形 $M_1 M_2 M_3 M_4$ 近似于平行四边形, 故其面积近似为

$$\begin{aligned}\Delta\sigma &\approx \left| \overrightarrow{M_1 M_2} \times \overrightarrow{M_1 M_4} \right| = \left| \begin{vmatrix} x_2 - x_1 & y_2 - y_1 \\ x_4 - x_1 & y_4 - y_1 \end{vmatrix} \right| \\ &\approx \left| \begin{vmatrix} \frac{\partial x}{\partial u} h & \frac{\partial y}{\partial u} k \\ \frac{\partial x}{\partial v} h & \frac{\partial y}{\partial v} k \end{vmatrix} \right| = \left| \begin{vmatrix} \frac{\partial x}{\partial u} & \frac{\partial x}{\partial v} \\ \frac{\partial y}{\partial u} & \frac{\partial y}{\partial v} \end{vmatrix} \right| hk = |J(u, v)| hk\end{aligned}$$

因此面积元素的关系为 $d\sigma = |J(u, v)| du dv$

从而得二重积分的换元公式：

$$\begin{aligned} & \iint_D f(x, y) dx dy \\ &= \iint_{D'} f(x(u, v), y(u, v)) |J(u, v)| du dv \end{aligned}$$

例如，直角坐标转化为极坐标时， $x = r \cos \theta$, $y = r \sin \theta$

$$J = \frac{\partial(x, y)}{\partial(r, \theta)} = \begin{vmatrix} \cos \theta & -r \sin \theta \\ \sin \theta & r \cos \theta \end{vmatrix} = r$$

$$\begin{aligned} & \therefore \iint_D f(x, y) dx dy \\ &= \iint_{D'} f(r \cos \theta, r \sin \theta) r dr d\theta \end{aligned}$$

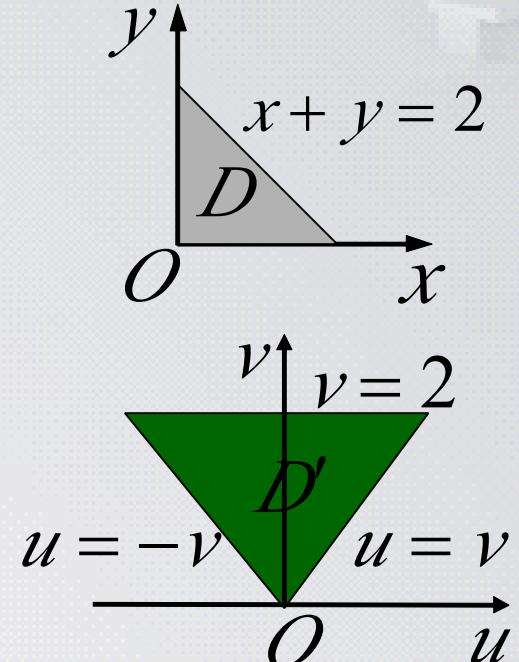

例8. 计算 $\iint_D e^{\frac{y-x}{y+x}} dx dy$, 其中 D 是 x 轴 y 轴和直线 $x+y=2$ 所围成的闭域.

解: 令 $u=y-x$, $v=y+x$, 则

$$x = \frac{v-u}{2}, y = \frac{v+u}{2} \quad (D' \rightarrow D)$$

$$J = \frac{\partial(x, y)}{\partial(u, v)} = \begin{vmatrix} -\frac{1}{2} & \frac{1}{2} \\ \frac{1}{2} & \frac{1}{2} \end{vmatrix} = \frac{-1}{2}$$

$$\begin{aligned} \therefore \iint_D e^{\frac{y-x}{y+x}} dx dy &= \iint_{D'} e^{\frac{u}{v}} \left| \frac{-1}{2} \right| du dv = \frac{1}{2} \int_0^2 dv \int_{-\nu}^{\nu} e^{\frac{u}{v}} du \\ &= \frac{1}{2} \int_0^2 (e - e^{-1}) \nu d\nu = e - e^{-1} \end{aligned}$$

例9. 计算由 $y^2 = px$, $y^2 = qx$, $x^2 = ay$, $x^2 = by$ ($0 < p < q$, $0 < a < b$) 所围成的闭区域 D 的面积 S .

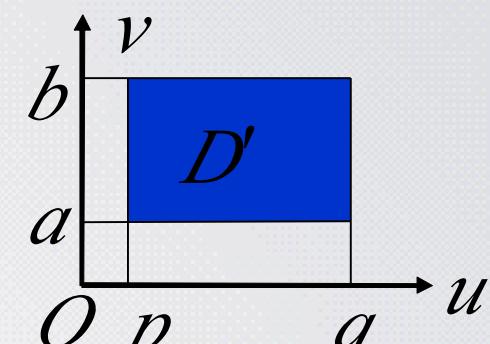

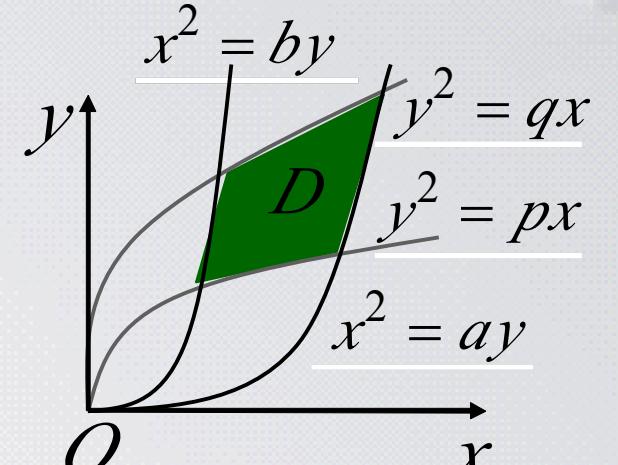

解: 令 $u = \frac{y^2}{x}$, $v = \frac{x^2}{y}$, 则

$$D': \begin{cases} p \leq u \leq q \\ a \leq v \leq b \end{cases} \longrightarrow D$$

$$J = \frac{\partial(x, y)}{\partial(u, v)} = \frac{1}{\frac{\partial(u, v)}{\partial(x, y)}} = -\frac{1}{3}$$

$$\therefore S = \iint_D dxdy$$

$$= \iint_{D'} |J| du dv = \frac{1}{3} \int_p^q du \int_a^b dv = \frac{1}{3} (q-p)(b-a)$$

例10. 试计算椭球体 $\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} \leq 1$ 的体积 V .

解: 取 $D: \frac{x^2}{a^2} + \frac{y^2}{b^2} \leq 1$, 由对称性

$$V = 2 \iint_D z \, dx \, dy = 2c \iint_D \sqrt{1 - \frac{x^2}{a^2} - \frac{y^2}{b^2}} \, dx \, dy$$

令 $x = ar\cos\theta$, $y = br\sin\theta$, 则 D 的原象为

$$D': r \leq 1, 0 \leq \theta \leq 2\pi$$

$$J = \frac{\partial(x, y)}{\partial(r, \theta)} = \begin{vmatrix} a\cos\theta & -ar\sin\theta \\ b\sin\theta & br\cos\theta \end{vmatrix} = abr$$

$$\begin{aligned} \therefore V &= 2c \iint_{D'} \sqrt{1 - r^2} abr \, dr \, d\theta \\ &= 2abc \int_0^{2\pi} d\theta \int_0^1 \sqrt{1 - r^2} r \, dr = \frac{4}{3}\pi abc \end{aligned}$$
